At a local ham store Icom Day the Icom tech guy said you could get moue drive out of the mic if you take the rubber disk out. He proceeded to show me with the demo 706 and it did not have the rubber disk. My 706 will easily drive past the recommended ALC range and distort the audio. I have not looked to see if I have the rubber disk or not.

Message-ID: <117cc$9351.1c3@news.hampshire.edu>
Source record: 207909
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

On 27 Dec 1995 22:48:51 GMT Michael G. Reiney (mreiney@hevanet.com) wrote in rec.radio.amateur.homebrew:

: I have an Atlas 210X that works fine on 40 meters and up. On 75 meters, I can only
: get about 40W out of it.
: I hypothesize that if the high freq power out is ok, the transistors are good.
: The 80M filters are not tunable, so they've probably not been tweeked.

I obtained a 210X a couple of years ago, before a year-long trip to Nicaragua (where I operated as YN1ASW). I thought an older simpler rig might be more reliable and maintainable in a situation where I would have little test equipment and parts accessibility would be difficult. I checked the rig out at home with a regulated power supply, but when I got to Nicaragua I had a number of unexpected problems. First, my power source was a 12V battery charged by a solar panel, and I found the Atlas really needed the extra voltage available when the battery was under charge, the output power would fall off a lot when the voltage fell from 13.6 down to 12V.

More seriously, I found that there were serious instability problems if the rig looked into a reactive load. It would work fine directly into a dummy load, but through a tuner into the load or into a real antenna, whether through the tuner or not, it would break into parasitic oscillations as the drive was brought up to a critical level. I don't know exactly what frequency the oscillations were, but they tended to wipe out my housemates' VHF TV reception, and this put major constraints on my operating schedule.

I was able to get some control over the situation by putting a high resistive load (I think I used something like 1000 ohms, 2 watts -- I had a limited stock of resistors) across the input of the tuner. The idea was to have a high enough value that it would take a negligible amount of power at frequencies where the load looked like 50 ohms, but at other frequencies where presumably the antenna and/or the tuner looked like some kind of high-Q circuit this might damp it enough to suppress the parasitics. I was able to operate at reduced power levels this way, but any attempt to go for full power would result in parasitics again.

My operation was mostly on 20 meters, sometimes on 15 when it would support my skeds back to the US. I never was able to get more than about 50 watts out of the rig.

When I first obtained the rig I got a packet of info from Hi Manuals, which included a lot of info on various mods in early production versions of the Atlas, some of which I recall had to do with power output or stability problems. As far as I could tell my own Atlas was a late enough model to incorporate all the fixes, but it still gave me a lot of problems. My conclusion is that it just pushed too hard at the limits of the technology of its day, and that variations in the semiconductors probably weren't adequately protected against.

I don't know if any of this is relevant to your problems, but maybe there are some connections. I would definitely look for parasitics that may be robbing power from the operating frequency.

If anyone reading this has any comments on the problems I experienced I would appreciate hearing them. When I left Nicaragua in Dec. 94 I put the rig in storage there, as I expect to return there for another extended stint in the next year or two. But it would be nice if I could go back armed with some ideas about how to get the 210X to behave a bit better.

I believe that it was an AN/PRC-112. Info on this radio can be found on Motorola's Web page, http://www.mot.com/GSTG/ged/rso/prc-112.html

This radio operates in the 225-400 MHz range. Their is a new radio with integrated GPS - specs can be found in the same URL, the page is gps-112.html

Any Corsair GURU out there?

SSB doesn't work. CW OK. No modulation with mike input or audio input on back panel.

Rig is 10 years old, but I like it. Excellent CW rig.

TenTec Repair Dept. sez return rig, but very expensive from this Island. Don't understand this, cuz usually they will ship a board. Also Repair Dept. has big load at this time - hence, long wait.

With SSB gone, can't work any digital mode, RTTY, etc.

Have all manuals, minimal tools. I can swap boards tho!

>my limit now.

Your price range is enough for a used Ten-Tec Corsair II or Omni V. These rigs hold their value well but they are in somewhat short supply on the used market. You may need to be patient in order to find one. Because they are now sold direct, the factory in Tennessee takes trades and resells the used gear. This is another possibility for locating the model you want.

Do yourself a favor a take a look at these before opting for an imported transceiver.

The PRC-90 doesn't have too much of a range. Line of sight. The
ELT's(Emergency Location Transmitters) Have a better range being they are
picked up by satellites & only takes a matter of minutes to triangulate a
position fix. Also they have a jack for the standard Military Aviator helmet
to plug into them for voice communication capability. The PRC-90 is best used
by placing it on a hill & letting it beacon for you. (and attracting any
local bad guys :))
I believe the ELT's are supposed to be part of any military & civilian
aircraft equipment. As far as using it to transmit. I don't think the
freq it has programmed is for anything BUT emergency use only. Also IF
you do happen to use one it won't take BUT a few minutes for the Military,
Probably the FCC & whoever else listens to the channel to pinpoint your
Lat & Long. I'm in the Army National Guard & we have had a few incidents
where the ELT's went off accidentally OR when some unauthorized personnel
had grabbed it out of the Aircraft & was transmitting. Everyone involved
takes it very serriously.

If you have no success with the manufacturer you might try this.

Many RF modules can be (carefully) pried open. You will find some descrete parts as well as the transistor die encased in a clear conformal coating. Look for burnt parts or open connections. You will have to scrape the conformal coating to solder any loose connections. I once found a loose external power/bias lead on a Motorola part. If the transistor is smoked forget it.Good luck..

Hi,

Need information for Masters research on Amateur Radio Mfg. industry. Any data relating to R. L. Drake's and Swan's departure from the Amateur Radio market place would be of great interest. They seem to have evaporated from Ham pubs in 1983-84. Any data on these two companies will help. Commentaries from folks who may have worked for these firms or dealt in their products would help. I would also like to hear from users of the gear past and present. Especially interested in what folks consider to be the reasons for the demise of the American Radio Amateur Manufacturing Industry.

Hi Mike,

I was in the same situation as you, interested in the 690 and the IC 736.

However, for the money, I just lost all interest when the Icom IC-706 came out.

There are about 10 in town already and everybody loves them, esp. the 100 watts on 6 and the ability to replace a 2 meter ssb rig.

Considering no "top of the line" HF rig offers 6 meters, I am saving my pennies for the 706. I don't see how, for the price, the existing "mid-line" HF+6 rigs can compare. However, the 706 might cause the used 736 & 690 prices to drop quite a bit. The used prices around here have been more than the 706 NEW. Good luck, Dave WE6L Phoenix AZ

22. Inside 706 Mic....?

Message-ID: <4c8bh7$kch@newsbf02.news.aol.com>
Source record: 207926

Have any of you tech types dissected an Icom 706 hand mic.....#HM-103...?

I peered inside and found a regular looking electret mic element buried below and behind the plastic front plate. Behind the slots that you speak into there is a large metal disc....about 36mm in diameter and 2mm thick, with a thick rubber pad in front of it. It's just screwed to the faceplate, with no electrical connections to the mic or circuitry.

Any good explanation for this design? Seems that the metal disk and rubber would hamper more that help. Anyone experimented with this?

Thanks.....

Bob,

The last joint-effort ham gear involving Swan was marketed under the Cubic/Swan name. At some point however, Cubic divorced itself from Swan, which left Swan without a "sponser". Cubic's last transceiver, the Cubic Astro 103, does not bear the Swan name anywhere, nor does their owner's manual or service literature. However, the rig still retains an S-meter with the red Swan "S" insignia. Perhaps someone with the predecessor to this rig (Cubic Astro 102BX) can tell you whether that rig was also devoid of the Swan name.

Although they're no longer manufacturing Amateur gear, Cubic is still in business as a government/military supplier. Their number in San Diego is (619) 277-6780. Also, Grace Brock, a retired Swan employee, owns and operates Brock Publications in Oceanside. Her company sells bound copies of Cubic manuals, and perhaps also Swan and Atlas. She might be able to give you the exact information you're looking for. The phone number for Brock Publications is: (619) 757-0372.

If this info is helpful to you, and if it's not inconvenient, I'd appreciate e-mail on whatever history you uncover.

73,
Jack WB3U

I have a young han friend that is trying to get a packet station on
the air using a Radio Shack HTX 202 and a Baypac tnc. This set up will
not work with the HTX 202, but works great when used with other radios
and ht's. There seems to be a problem with audio from the htx 202 to
the tnc. The tnc does not want to decode the htx 202 audio. But
remember, it works great with other rigs??????????
We playe dwith the deviation and it did not help the problem. I did
this in spite of the fact that i belive that it is a problem with the
audio out of the radio speaker jack, not the tx audio.
THE QUESTION IS........
Has anyone had this problem???
If so, how did you fix it??????????
Your help would be greatly appreciated.. The subject tnc has a xmas
gift for this 11 year ham.. He is dying to get this thing on the air!!
tnx and 73 Mark.. NU8Z

I glanced through Scott O'Grady's book (_Return With Honor_) while
at the mall last week. The most I can gather from O'Grady is that
the initial contact between O'Grady and the search craft was by
voice. O'Grady speculates that the search party had heard his
radio's low power "guard" mode, which, I take it, is a beacon.

There was no mention, at all, of Morse code. The reports of Morse
code use appear to be unsubstantiated.

No QSK on the L4B... the L7 has full breakin. You'll need to mod your L4.

Source record: 207999

Friends,

I am interested in purchasing an all band plus 6 meter rig in the near future and was wondering if any of you out there have personal experience with either of these rigs? There are advantages and disadvantages to both and I am interested to here from those of you who have them who may have some useful info to help me decide which of these two to buy (or if these are even the best to consider!). I have only had my Ham license for a little over 2 years and greatly appreciate the experience of those of you who have been in the hobby a lot longer.
I currently have a Kenwood TS-820S, but it is out of action. I sent it in to Kenwood Australia a while back for a minor digital display repair and got it back with a blown bias circuit and blown tubes. Needless to say, Kenwood claims it was working when it left their shop and so I've been left holding a boat anchor. This has put me off Kenwood more than just a bit. In the past, I've had nothing but Kenwood equipment, from car stereos to home entertainment equipment, but this last run in (which is a real long story unto itself) has left me reconsidering my next HF radio purchase. So, I come to those of you with more experience than me.

Best 73's and good DX!

Hey Rick. I wonder if that's why no one can get enough alc? I'll let you experiment with it then maybe try mine. What say you just fire up the rig with the mic opened and try modulating it with the extra parts out of the way?

Message-ID: <4cbcuv$aa7@falcon.varian.com>
Source record: 207862

Hi, just curious if there are any other Ford Explorer owners out there who have IC 706's installed. I am in the process of installing mine, but am up in the air about where to put the main unit. I mounted the remote head above the 4 wheel drive buttons and routed the control line in the crack between where the front dash face meets the top of the dash.

Right now, the main unit is in a tupperware box (without lid, god knows ham radio has enough lids!!) under the driver's seat, but I am worried about moisture getting into it there.

Advice from others who have studied the same issue would be appreciated.

Hello Joe,
I had to laugh-we poor Amateurs in the UK pay in Pounds what you pay in Dollars
in the US generally...!
Although the price is somewhat variable in the UK, we would have to pay around
1100 to 1300 Pounds for the '706...that's about 1600 to 2000 Dollars! Of course
we are taxed to the hilt here with Value Added Tax at 17.5 percent,etc, etc.
Consider yourself VERY lucky that you can buy gear so cheap in the US!
I'll see if I can find out how much the '706 would cost in OK/OM-at a guess it
would be 3000 Dollars!
Regards and a Happy New Year!

: 73. Ed.

I used an FT-980 with two versions of K5YEF's program with no program problems.
I did find that the program would hang if the input wasn't just quite right
though. I had lots of subtle problems with my interface. When these were all
cleared up, all was well. The FT-980 interface is really quite strange. All
commands are repeated back to the computer for verification. The K5YEF program
does actually do a verification, so if something is marginally wrong, it will
not send the execute command to the xcvr and it hangs. (I think thats what
happens. Been a while since I have looked at the program.) Check the
interface to be sure that the waveforms are nice and sharp and square. Would't
hurt to call K5YEF, either. He seems to be a very nice guy.

Source record: 207875

I bought a McElroy bug over the holidays and I'd like some info on it (age, value, etc).

It has a cast iron base, with black wrinkle-finish paint, that is 6" long and 3-7/8" wide. The beam, damper, and most of the hardware is chrome plated. There are three suction cups on the base to hold it in place (although they are rotted). The nameplate says "Radio Telegraph Apparatus by World's Champion Radio Telegrapher", then "T. R. McElroy Boston, Mass. U.S.A." and also a MAC logo.

Any info appreciated. E-mail to QRP%mimi@magic.itg.ti.com

Source record: 207877

Hi all,
My folks just purchased an Icom 2GXAT 2m handheld. At least initially, it is limited to ham band receive, but the specs of foreign models of the same radio imply the capability for extended receive. I suspect this is done by simply holding down a few keys during power up, but don't know what they are? Any 2GXAT owners out there who know the answer?
Regards,
Paul

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Hi,

I'm interesting in purchasing either the Yaesu FT-530 or Icom IC-W21AT dual-band HTs. Both manufacturers are having specials on these models and they can be had for about $380 new. Can anyone recommened either of these 2 radios or are they about the same? Apparently the IC-W21AT is a close-out so I can't find info on this model in any of the magazines.

I'm also interested in purchasing a used dual-band HT (2m, 70cm) or used 2m HT so if you have one in excellent condition that you'd like to sell please send me e-mail.

Thanks,
-David

68. Info on IC-706 ???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-02 00:00:00 UTC
From: hduff@humnet.humberc.on.ca
Message-ID: <8206265744302@lss.humnet.humberc.on.ca>
Source record: 207880

I've seens several posts about the IC-706...many are second or third
hand. I'd like to hear from OWNERS of the radio...I have some specific
questions...

1. Whats up with the lack of sensitivity just outside the 2m band ?
I understand that the rig is deaf as a mute though there is some
"yellow wire" mod that improves this. Does the same mod adversly
affect intermod on 2m ?

2. I read that the radio runs quite hot when using it during a QSO
even during an average TX/RX cycle. I also read that the fan
is quite noisy. Is the fan noise that bad ? Is the temperature of

3. People have been complaining about the poor mic audio on TX.
How bad is it and is there a concensus that it is common to
the model or perhaps just certain lots ? There was talk of
removing some rubber disk within the mic...what is it there
for and does it help ?

I've been a Kenwood man up until I saw this little ICOM innovation.
It really has my attention so I'm thinking of selling my TS-50
and a few other goodies to purchase a 706. I wonder if previous TS-50
owners who now own a 706 care to compare HF performance of both ?
I'm told that options for ICOM radios are expensive. What I can't
beleive is that the mobile mounting bracket for the 706 is an OPTION !?!?
C'mon ! This is a mobile radio. Even $50 CB radios come with a mount....
and ICOM (thru the dealers) want a pretty penny for this punched/painted
pressed piece of steel. I find this revolting.

Comments welcome preferably by e-mail.
Many thanks...

>Thanks

>Jim

Jim, I once used a "Solid State Relay" controlled by one of the output lines on a serial port. I controlled 110 VAC power to a device with it. I used a very simple BASIC program to switch it ON/OFF (BASIC can read your computer's clock and thus react to time changes).

The serial output ports have several (3-4) lines which can be controlled this way. Don't remember all the details. E-Mail if you are interested in building something of this sort and I will come up with more details. The circuit is VERY simple, as is the program.

>Just curious if this is unique to the USA or not.

Not only US Hams are paying too much! Also German Hams are paying too much. In our stores the Icom 706 costs about 2500 DM. That's equal to (based on an exchange rate of 1.43 DM = 1 $) 1748 $. According to your mail the IC 706 costs about 1300 $ in the US. Even there it is too expensive. So you see: German hams are also paying too much, but this is usally the case. Its the same with TV, VCR, Handycams etc. Technical equipment is much more expensive in Germany than in the US.

75. IC-706 Price -- are US Hams paying too much ???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-02 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <4ca8mt$nav@tilde.csc.ti.com>
Source record: 207936

For what it's worth---

Been seeing most prices for the Icom 706 quoted between 1199 and 1299 US$ from the big stateside dealers and from comments on the 'net. Most places that have them in stock seem to be selling for about 1249 $US.

Last week while in Singapore, I swung by Sim Lim Tower on Jalan Basar road and visited several of the ham radio shops. Several had the IC-706, USA version (at least according to the english owners manual and warranty card). What surprised me was the discounted price on those units.

In Singapore, the quoted price was between 1400 and 1450 SGP dollars. The exchange rate is about 1.4 sing to 1 US dollar, making the '706 about a thousand bucks USD. Not believing that this price was "real", I made a quick check with a few folks up in JA....

So...I called a JA friend of mine up in Tokyo and had him check the prices in Akihabara, also a well known shopping area for ham and electronics gear. Sure enough, the price on a US-version was JPY 98,000. With the exchange rate at about 102 yen per dollar, this puts the Icom rig at under a thousand bucks USD.

So...unless the prices in the states are going to drop after the first of the year, I'd say you all are paying about 2 hundred bills too much for that new rig! Judging by the number of units sold, the radio stores are finally making some profit margin!

Anyone in VK or G/F/I/DL/EA/SP etc. care to give a price in your neighborhood on the Icom HF IC-706? Just curious if this is unique to the USA or not.

Thanks and 73, Joe

p.s. I did NOT get one in Singapore Just was checking prices.

84. Yaesu FT-736R AGC Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-02 00:00:00 UTC
From: lloyd korb <korb@xraymkt.picker.com>
Message-ID: <1996Jan2.152815.28543@picker.com>
Source record: 207945

I have an apparent AGC problem with my FT-736R. There is an audio distortion (crackling sound) with the RF gain control full CW. If I back off the gain so the S meter does not move there is no problem. As an example, if the signal is say an S9 I adjust the gain so the S meter stays at S9. At this point there is no problem. As I increase the gain, so the AGC starts working, the distortion comes back. It is also noticable on noise. If I have say an S2 line noise level I get the crackling noise until I adjust the gain so the S meter sets at S2.

I have had the rig back to Yaesu one time but they did not correct the problem. The warranty runs out in May so I would like to get this resolved.

If you have an FT-736R I would appreciate any help you can supply.

Please respond to my E-mail address since I can not receive replies here.

Thanks, 73

Mats:

Which Paragon do you have, the original or the Paragon 2 ?

I have a first generation Paragon (bought in 1988), and
have some experience with remotely controlling the radio.

The newer Paragon 2, which's been available for either
1 or 2 years (can't remember) has a completely different
processor, and its control protocol follows the ICOM
CI-V standard very closely.

> 73 de VK3EAP / AA3DB Alan Ponting Happy New Year

Alan (also responding directly via e-mail):

When I bought my FT-530 in June 1993, it was no problem to get Yaesu
to fax me a modification sheet, showing how to 'open-up' the coverage.
I have heard that since then, Yaesu has become very reluctant to
provide the information (presumably due to that fool U.S. regulation).

My FT-530 required that 2 or 3 tiny 'jumpers' be removed from the
circuit board, and then the radio was powered-up while holding down
certain keys (think the "Up" button). A friend bought a FT-530 last
year (1994) at Dayton, and his radio's circuit board had a much
simplier method to allow the coverage to be expanded, as it had
a green wire that simply got 'snipped' (there may have been a bit
more than that). So, there appear to be at least two slightly
different circuit boards available.

With my radio, the only problem was that the surface mount components
(the 'jumpers') as VERY small. There were (I think) two solder 'blobs'
that had to be removed (turned-out to be simple, one touch of small
temperature controlled soldering iron tip, and the surface tension
pulled the solder off cleanly), and one "zero Ohm" jumper. The "zero
Ohm" jumper was so tiny that, when I got it off, I stuck it under
a piece of tape, and put it on a file card, just so I could remember
how small it was. It looks like a tiny fleck of solder.

My FT-530 now covers down to 110 MHz, and so I can listen to aircraft,
which is why I did the modification. The FT-530 does suffer from images,
as it's receiver 'front-end' is wide open, so you may hear 2 Meter
repeaters 30 MHz (twice the 1st IF) below their true frequencies.
But, that's a common problem with the new radios that can tune from
'DC-to-blue-light' (to quote an old Air Force friend).

Good Luck;

Paul Nix, WB5AGF

Yup, I've had to replace mine in my Yaesu 5100 after 14 months of use.Have a feeling it was a heat related failure - the heatsink is too small on this radio (imho), combined with the thermistor that turns the cooling fan on & off. Anyway, I did the mod to have the fan on all the time...wish I would have got to it before it fryed :-(

Took about a week to fail solid - first it would cut out on hi power (50 watts), then it worked fine just on low power, then nothing.

Joel

I'd be interested in the Astron RS-35M Power Supply. I'll offer $80 if it's in decent working condition. This is the next item I need and was planning on purchasing at the next ham fest if I find one.

I'm guessing you want to sell everyting as a lot. If not let me know on the supply.

Thanks and Happy New Year.

I have found and used a couple of pc programs that will use the Yaesu CAT system to control hf radios (ie: FT-890)from the pc serial port. So far all I can find are DOS versions. Are there any nice windows (95?) versions that give you a picture of the radio and all of that neat stuff?

I am not surprised the shops in S'pore are offering the '706 cheaper...over the years I have dealt on occasion with various stores along Nathan Rd. in Hong Kong and found the same thing. However, I found this true with pretty much all rigs from all the Japanese manufacturers. It seems that they'll work on slimmer margins (what they lose on each sale they make up in volume!!) then pretty much all stores in the USA, so its not just the '706.

Best Regards

Chris; you probably have an impedance mismatch rather than a bad microphone. Drake used to supply a hand held high impedance ceramic mic with their earlier T4XB transmitters, I believe
that the TR-7 mic looked very similar but was entirely different. Check and see what your desk
microphone's specified output impedance and levels are, and then try a handheld with similar
specs.

98. Antenna Tuner for IC-706; other comments

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-03 00:00:00 UTC
From: rcarpen@DGS.dgsys.COM
Message-ID: <Pine.SOL.3.91.960103155210.2614A-100000@DGS>
Source record: 207809

While ICOM may have designed the AT-180 for the IC-706, you will note
that the 706 also carries a socket that allows direct connection of their
AH-3 automatic tuner. The AH-3 is claimed to tune essentially any piece
of wire, while the AT-180 can only hanadle a range of nearly-resonant
antennas - as best I can read the specs.
So, forget the AT-180; get an AH-3.
Anyone have a good used AH-3 that I can buy??

Despite the miracle that is the IC-706, ICOM seems to have pulled a
couple of boners in its design.
1) Not understanding(?) the non-ham VHF environment in North America and
Europe has led them to accept a design which results in far too much
intermod above 60 MHz (except where the "2 meter" front end filter can be
used - see yellow-wire mod).
2) A similar lack of understanding has led them to choose a far-too-wide
FM BC IF filter. Appropriate-bandwidth filters, with the same dimensions,
are available from the same manufacturer that they use. Since most FM BC
radios are made in the Far East and Japan, I'm surprised that ICOM's
engineers were unaware of good engineering practice in the choice of the
IF filter.
Ah, but I've been seeking perfection. The 706 would still have been my
choice even if I had I known of these problems before purchasing it.
There is no competition for my uses: 100W up through 6m, all-mode 2m,
general-coverage LF-MF-HF receiver with wide and narrow IF on AM, coverage
to look for European TV below 6m, air-band coverage, 162 MHz weather
coverage (with yellow-wire mod). A judiciously-tuned single L-C trap
allows me to hear the FM BC stations that are most important to me.

In article <4c7a4q$ekl@news.aros.net>, mfp@aros.net (mfp) wrote:

> Question, since ICOM, won't answer this, is the HF+6 meter side of the
> IC 706 a double or triple conversion receiver....

Response:

If you're talking about SSB & CW, then I believe double conversion
is the right answer.

The IC-706 converts incoming signals to a first IF of about 69 MHz.
That's then mixed down to 9 MHz, which's where SSB & CW get demodulated.
Best I can remember, narrowband FM gets mixed down to 455 kHz (don't
have the schematic at-hand to confirm this), and I think the wideband
FM gets mixed to the 'usual' (for FM broadcast radios) 10.7 MHz.

Miscellanous Comments Regarding The IC-706's Mixing Scheme:

With the IC-706 using a DDS derived frequency reference, in the 'middle'
of the PLL synthesizer that supplies the 1st mixer's injection, and with
a second DDS chip providing the 9 MHz 'BFO" signal, a rather interesting
capability is used to provide the 'passband tuning'. Whereas on other
radios the 'passband tuning' feature is usually provided by mixing the
incoming signal 'across' a narrow filter's response, and then mixing it
'back' to the original frequency range, using the same oscillator to mix
the signal 'across' the filter and then 'back' to its original frequency
(such that there's zero frequency offset), on the IC-706 'passband tuning'
is provided by 'slewing' the 1st mixer's injection frequency one 'way',
while simultanously 'slewing' the 9 MHz BFO the 'other way'. The net
effect is to 'move' the signal 'across' the 9 MHz filter's characteristic
as with the older method. If you 'twist' the passband tuning quickly,
while listening to an AM station via the SSB mode, you can, just for an
instant, hear a beat note as the 1st mixer's injection frequency, and
the BFO frequency, don't exactly counteract each other (I suspect the
1st mixer's injection frequency is a little slower to respond, since
it's derived through a PLL synthesizer, whereas the 9 MHz BFO signal
is coming directly out of a DDS chip, and that should slew frequency
very rapidly).

The IC-706 has a 'true' FSK RTTY modulation capability (although it's
of questionable use with Amateur digital schemes moving towards multi-
tone formats like CLOVER II and PacTOR II). The 9 MHz DDS chip (which
also provides the BFO signal during receive) is switched back-and-forth
by an incoming DC keying signal, to directly generate an FSK signal.
That 'says' that ICOM depends on their 9 MHz DDS chip to be able to
switch quite rapidly between two selected frequencies. The IC-706's

'setup' mode lets the user 'tell' the radio's processor what FSK "Mark"
frequency, and what "Shift" to use on RTTY, selecting from 2 or 3
choices that the processor 'knows' about.

What about the Alinco DX-70T? I have one and really like it.
It runs a solid, honest 100 W PEP,and the audio reports have
been excellent. Great receive audio also. A good basic rig
that's perfect for mobile use (mine is a dedicated mobile).
It doesn't have some of the bells-n-whistles that the Icom
has, but it's $300 cheaper, and really, how much of those
fancy features will you ever use while operating mobile?
The DX-70T is also remote-able using optional cabling kits
and mounting hardware. The Kenwood isn't, and the Yaesu
leaves many of its controls on the main chassis when the
front panel is remoted (inconvenient).

Just my humble opinion. 73 de KC5NG

Hi: I bought a Kenwood 621A 2m/220 mobile used recently. Works fine and I'm satisfied with it, but need some info. Looking for a manual and instructions for the out-of-band mod. The radio already has the mod, so my interest is in reversing it. Also interested in hearing of any undocumented features this model may have.

Also looking for whatever optional extras were made for the radio. Things such as a remoting kit, PL DEcoder, voice module or anything else. Perhaps someone out there knows if there were other models that used the same options? A list of model numbers and option model numbers would help in my search.

Thanks much, Chris Weddle, N7RME, Mt. Lemmon, Az.

G OTTRIA (gottria@aol.com) wrote:
: Just wondering if this radio is good. I've looked at this radio and it
: looks preaty good. I The Yaesu FT-8500 and don't really care for it.
: There's to many movements to just program th PL. So I'am looking at the
: DR-610. Any comments???

I just picked up one before Christmas. This is my first Mobile rig, so I may be off base here, but the usability of the DR-610 is, well, lousy. I have no experience with any other mobile radio, including the Yaesu "Mister Potato Head" rig.

I also have an Alinco HT (580T), and the two radios have some of the same programming sequences. In fact, that was one reason I went with the 610 - to have a common interface. My base rig is a Yaesu FT-767, and my fingers have a hard time going from one to the other.

The problem with the 610 is that it seems that there were either 2 or 3 different people working on its user interface. It's inconsistant, which to me is worse than just being clumsy. For example, to turn on one sort of scan, you hit the scan button. Hit it again to turn it off. Good. Now you want to scan differently, well, you hold the UP or DOWN microphone button for a second. To turn off, hit Scan (on the radio, not the Mike!). A third "scan" (the spectrum analyzer) turns on with the button next to scan (I forget how it's labeled, but it's not at all obvious how the label and functions are tied), then to turn off you need to hit F, *THEN* the key. Similar inconsistencies exist with changing memory banks (MR key or the knob on the left), the allocation of some functions as primary (T/TSQL) vs secondary (SHIFT) is different than the HT, use of the F key to complete a sequence sometimes and not others, etc.

There is also a rather small two-sided (rocker) switch located above the left knob which controls access to VFO A/B or Memory, which is too small, and too close to the knob. There must have been a better place for this switch, and/or allocation of those functions to the main row of buttons.

I also object to the now-common practice of making the first 2 digits of the frequency in a smaller font than the rest. When you can use either band on either side of the radio, those first 2 digits (14 vs 44) make a *BIG* difference; they are as important as the rest, and should be displayed so.

Now, ignoring for the moment how you access them, the radio's features are great. Even though it looks like a gimick, the crude spectrum analyzer (Channel Scope, I think they call it) is useful. The radio has good frequency coverage, including air-band, lots of memories, and 2 VFOs on each side for each band. I have yet to get it installed in my car, but sitting on the bench it has performed well. I have no complaints here.

Perhaps the usability, or rather, the lack thereof, is "normal" for mobile radios. If so, the amateur radio industry has a great opportunity here!

Can anybody get a schematic for a Motorola handhelp speaker mike, part # NTN4849A ... I picked it up at a hamfest and wanted to use it on my radio, the speaker mike works fine but when you transmit nothing comes over the air (it keys up though). I did have to rewire it but the circuit is SMT and I'm having problems generating my own schematic... Thanks for any help!

Reply (also going direct e-mail)

Hugh:

Regarding the receiver above 60 MHz

Above 60 MHz the IC-706 uses two different filters during receive.

Inside the 2 Meter ham band there's a pair of transformers coupled
by a very small capacitor. I think the circuit is probably tuned
to act slightly overcoupled, to produce a 'flat-topped' response.

When the radio's tuned outside the 2 Meter ham band, a 'lowpass-
highpass' filter combination is used between 60 and 200 MHz.
From some very rough calculations I've run, reading the component
values off the schematic, and then punching them into my little
hand calculator, it looks like that's going to provide a response
somewhere between 45 and 125 MHz (there are "Poles" and "Zeros"
in the filter response at roughly 41 and 130 MHz, so I'm guessing
how far away the signal has to be to make it through the filter).

The "yellow wire" modification apparently causes the radio to
keep the 2 Meter filter in-circuit ANYTIME the receiver is tuned

above 60 MHz. From the e-mail chatter I've seen, that apparently results in substantially increased sensitivity up to about 165 MHz, but the guys say the receiver overloads fairly easily.

With my unmodified radio, I've noticed some pretty severe interferance when listening to the commercial FM Broadcast Band here in the Dallas area. But don't forget, ICOM doesn't spec the receiver's performance above 30 MHz anywhere except INSIDE the 6 and 2 Meter Bands. Anywhere else is a 'freebie'.

Concerning temperature

I've only used my IC-706 on the HF bands, but it barely gets warm. That goofy little fan (inside the radio) runs all the time, and speeds up during transmit, but the radio, even given its tiny size, seems to have no problem coping with 100 Watt SSB transmissions. Matter of fact, I've become curious what kind of 'idling' current the output transistors are set to. The IC-706 uses Motorola RF FETs, and they may be much more efficient than the bipolar transistors that are used in older radios.

Microphone Audio

I have had some concern about that ... not that it's distorted, it's just that I can't get the ALC indication to reach the level that the manual talks about. The pattern I see on my old Heath HO-10 monitor scope looks good, so I'm trying not to let the meter reading concern me. If I cut the RF output back, which I believe just changes some parameters in the ALC control circuit, then I can 'push' the ALC indication to where the manual says it should be.

The microphone provided with the radio has two rather strange metal and 'rubber' disks inside, actually blocking-off the 'grill', that make it appear as though the ICOM Engineers were trying to reduce the sensitivity. An ICOM Rep (Gary Fiber) suggested that I try removing the metal & rubber disks, to see if that would bring up the audio level. It may have helped a little, but I still run the IC-706 (when the RF transmit is set to "Hi") at the maximum (set in software) of "10". I do have a very soft voice, and many years of experience have shown that transmitter ALC circuits respond quite a bit less than when driven by more bassy voices.

One thing that really bothers me, that nobody's talked about, the microphone PTT switch has this bizarre 'snap-action', that clicks so loudly that, when you unkey there's a very distinct RF 'spike' that goes out on the air (I see it on my monitor scope). If you run VOX (of course) you don't depress the PTT switch on the Mic, so no 'spike' is transmitted. I think that I'm going to try and change-out that switch, as that's just plain dumb design on the part of ICOM, and no excuse for it.

I'm building an interface to allow me to use a Heil headset with the IC-706. When I called Heil, to get their opinion as to what needed to be done, the lady there commented that they've had problems with low audio when connecting to other ICOM radios, so I'm building up a little audio amplifier (took it out of the ARRL Handbook), to go into the adaptor box, to allow me to include a bit of gain if needed.

From: j.crutch@ix.netcom.com
Message-ID: <4ceulp$t86@cloner2.ix.netcom.com>
Source record: 207825

I Have a Yeasu FT-5100 New out of the box. It comes with one Operation manual witch shows the basic commands and how to turn on the radio. My questions is shouldnt there be a second manual that goes with this radio for functions like cross band repeat that the original Operation Manual did not include. I know the radio can do much more than the manual indicates.

If anybody knows if there is more information and where to get hold of it. Any help would be Great...

Thanks...

116. Need help with JRC JST-245 problems.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-03 00:00:00 UTC
From: swithrow@nyx.cs.du.edu
Message-ID: <4cfr7m$k6h@nyx.cs.du.edu>
Source record: 207827

I have a Japan Radio Corp JST-245 that seems to have two problems,
and would like to know if these have been seen before or if there
are known fixes.

1. The carrier balance seems to be only 30-40 dB below peak output.
I'm sure there is probably an adjustment, but why should it be so
far out on a relativily new radio. Is there some problem with this
radio not staying in carrier balance adjustment? Measurement was made
with a spectrum analyzer, and I haven't tried adjustment to see if
it will get better.

2. The transmitted signal has impulse noise outside of what the
expected signal bandwidth would be. This noise is correlated with
voice peaks and get worse with compression on. Even with careful
adjustment of MIC gain it will not go away. Could it be ALC related
or generated. This "crackling" can be heard for several kHz (5-6)
away from the signal frequency.

Any insight would be most appreciated.

I still think that having a good synchronous detector instead of the FM BC capability would have been a distinct improvement.

I don't need another FM BC receiver, but I certainly could use the improved performance of a sync detector on the HF freqs, especially for SWBC listening.

ZaaX <zaax@aol.com> writes:

>I would be interested in any comments on the Alinco DR-Mo6T or Azden
>PCS-7500H 6 meter rigs. Any info will be greatly appreciated.

I have had experience with both radios and have very definite thoughts
about both.

I first purchased the Azdden PCS-7500H. As soon as I got it, I installed
it in the car. Within 2 hours I knew this radio was not for me. It
suffered from the worst case of intermod I have ever heard. It had little
to no rejection for adjacent channel interference. I also discovered the
radio was quite deaf to in-band signals. It had worst 6 meter performance
than my scanner! The next day I called Azden to arrange to return it.

Now on to the Alinco 6 meter radio. I have the DR-M06 which is the 10
watt radio with 99 channels. From day one it worked great, granted the
programming required some work to get it down right. In and arround the
metro Boston area, it suffered almost no intermod related problems. The
receiver turned out to be quite hot, allowing me to hear repeaters from the
middle of the state and from southern NH with no problems.

If you are choosing one to buy, I recommend the Alinco.

By the way, I have replaced my Alinco 6 meter radio in the car and would
like to sell it. Interested? Reply to this.

From: markem@primenet.com
Message-ID: <markem.192.00DBE8D8@primenet.com>
Source record: 207835

Our club recently acquired an Aerotron UHF repeater that's crystalled for 462.something. We'd like to move it down into the 70cm ham band. Unfortunately, even tho we got an apparently complete set of manuals with it, we can't find any specs for the channel elements so we can order crystals. The rock makers don't seem to know about them either. Anyone have any experience with these boxes? Attempts to contact the company (Aerotron, Inc. in Raleigh NC) lead us to believe they're not in business any longer. It looks like a nice unit and the price was right even if we use it for parts (the power supply alone is worth the price) but it would be neat if we can get it on the air.

Any info will be appreciated.

Date: 1996-01-03 00:00:00 UTC
From: Norm_Beasley@sil.ORG
Message-ID: <01HZLX0SQL22000906@SIL.ORG>
Source record: 207837

G'Day to all readers of the digest,

I have recently purchased a Kenwood TH-225A VHF handheld. The radio is about three years old. It seems to be a fairly rugged unit and is easy to use. However, I would like to know if there are any modifications to open up the receive coverage of this unit on this unit. It receives from 141.000 to 162.995 MHz now, but I am not sure if this is the "stock" receive range, or if the previous owner modified the unit to receive over this range.

I would like to be able to receive 136.000 to 174.000 if this is possible. Or whatever is the maximum receive range of this unit. Transmit coverage modifications to cover this range would also be accepted, but would be considered "gravy".

If anyone has experience with this unit, I'd be interested in hearing the good, the bad and the ugly about it. Please respond here for the benefit of all readers. Thanks for your time and help.

Sounds like a Mocom 70 consolette. It probably will tune down to 10 meter FM band. You will need a manual and crystals. Dont spend too much!!

128. Wanted: Information on the TAIT T535 Series II radio

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-03 00:00:00 UTC
From: Norm_Beasley@sil.ORG
Message-ID: <01HZLX0TRK32000906@SIL.ORG>
Source record: 207839

G'Day to all readers of the Digest,

I have acquired a TAIT T535 Series II radio, which is a 2 channel, 25 watt, type approved, commercial VHF band, mobile radio. Made in New Zealand. Fairly popular in the South Pacific countries, maybe also in Europe(?).

I have some questions and wonder if anybody out there has done much with this type of radio on the amateur bands. If so, I would like some help.

1) What needs to be done to modify the radio for the amateur bands? It has a diode matrix board for programming in the 2 (two) frequency pairs. Can the radio be modified to use the existing diode matrix board for programming more than the two fairly fixed (change by resoldering) frequencies? How? Is there any way to add an operator "interface" that would allow easy, multiple frequency selection? Is frequency scanning an option?

As far as frequency selection: the only quick and dirty way that I have heard of would be to buy four "banks" of DIP switches and solder each individual switch to a diode pair (i.e.: each individual switch on each DIP switch bank would open/close a diode pair which in turn would add or subtract a set amount of frequency spectrum). One bank for Channel A Transmit, another bank for Channel A Receive, etc. This would need to be used in conjunction with some kind of a graph or drawing to show individual DIP switch settings for each frequency of interest. It would be incredibly klunky, awkward and slow. Would BCD/thumbwheel switches be an easier/better way to do this?

I understand that the Ramsey line of 2 meter radio kits uses a diode matrix board for programming frequencies. Has anyone modified a Ramsey kit for frequency selection beyond what the diode matrix board allows?

2) If #1 above is not a good (easy/cheap) option, maybe I should think about making this a packet only radio. How does this radio perform on packet? Is this radio a "true FM" radio or does it use another type of modulation? Any special tricks to make the radio more packet friendly?

3) Is the radio a good candidate for faster than 1200 baud packet? Can this radio perform at 9600 baud? What special tricks need to be done to make it work at this speed?

Anybody care to share their experience with this radio - the good, the bad and the ugly?? Please respond here for the benefit of the Digest readers, although there is probably a very small audience of TAIT equipment users.

Thanks for taking the time to read this.

130. FS: TI C5x DSP Starter Kits (DSKs)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-03 00:00:00 UTC
From: cole@netcom.com
Message-ID: <coleDKL9LC.I90@netcom.com>
Source record: 207885
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I have several TI 320C5x DSKs (DSP Starter Kits) for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from the TI BBS, accessible via TI's FTP host ftp.ti.com, in directory /mirrors/tms320bbs. The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them through distributors can be a hassle. I'll sell them for $60 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are OK but I'll wait for them to clear. No CODs, please.

Bruce,

Having had all 3 I will give some non technical comments.

At the present time, my opinion most bang for your buck is the Icom-706! I have mine about 2 weeks and love it. Remember it is a HAM RADIO not a scanner! However the yellow wire mod does increase receive sen. at 160 considerably. The may be a little more intermod after the mod is done, but I can put up with it considering I got an HF rig a 2 Meter rig and a 6 Meter rig all for $1140.00 Del..... With the addition of some out of band RX that is ok in the VHF 150's and around 50MHZ, a great deal for the money.

Now for the TS-50 a good deal for a mobile HF rig small insize good specs worked well, no internal tuner and cant remote mount, some good used deals around on them. I just sold mine for 650.00...

The 900, if you want an HF only rig with an internal tune and very good specs as far as an HF rig this is the best it gets with the remote mount etc....

I still have one and my put it in mobile permantly, however , I may still opt for another 706.

All in all dollar for dollar I think the 706 is the best value..

If you have any specific questions feel free to ask.

>please send me e-mail.

I have a Kenwood TH-79 with all the trimmings:

5w battery pack
3w double-life battery pack
alkaline pack
MFJ speaker/mic
2-pack rapid charger (75min on 5w pack, 90min on dbl-life pack)
antenna
soft case

Radio has 80 memories +2 calls. Aside from 2 calls (one on each band),
the 80 channels can be distributed between the two bands as you need
them. It's not necessarily 40 per band. All channels can be labeled
with a 7-character alphanumeric ID.

PL encode/decode also included.

If interested, make offer. E-mail please, to jtriolo@mci.newscorp.com

Response:

I've had a Paragon since March 1988, and its never broken. I have
made a few modifications to it, to make it do some functions a bit
differently, but the radio itself has never failed.

I use my Paragon a lot on AMTOR & PacTOR, and its QSK functions
flawlessly. Originally the Paragon had an external amplifier keying
relay, and its clicking drove me to distraction. But, I wrote Tentec,
and got a personal letter back from one of their VP's, who ran his
Paragon a lot on AMTOR also, and he said just to remove the relay,
citing its reason for existance as being "for the SB-220 owners

of the world". Once I pulled that relay out, the Paragon became so quiet, while running Mode A ('ARQ') AMTOR, that about the only way to tell it was switching back-and-forth between transmit and receive was to watch my ancient Heath HO-10 RF Monitor Scope.

If I was smart enough to do it, I would like to rework the synthesizer, to include a bit of DDS design, as I'd like to 'lock' the 9 MHz sideband generation source to a master reference. I'd also like to give the radio a 'smarter' RS-232 command set (the little Motorola 8 bit CPU has about all it can do in controlling the radio). But, both of these are 'things I'd like'. I have no plans to get rid of the Paragon at any time in the foreseeable future. Its control layout is EXTREMELY EASY to use (ie. all the buttons are logically arranged).

Response:

John (N3SKO):

I have an SG-230 tuner, and an ICOM IC-706, but haven't had a chance
to try them out together yet. The radio's only a month old, but I've
had the tuner about 3 years.

I think that SGC prices their gear a bit more than perhaps I'd like,
but I must admit that their tuner seems to work as advertised. I go
out portable sometimes, and the SG-230 has always managed to find
a match to whatever kind of wire I've thrown over the nearest tree.

It might be very interesting to find how the ICOM tuners fair; they've
got one or two units that physically resemble the SG-230, and so their
intended use might also be construed to be similar.

I don't think anybody else's tuner has the SG-230's 'memory' function. Once its found a match, if you change frequency, and then come back fairly near to that earlier one, the tuner 'remembers' what the settings were, and it'll check to see if they still work. The effect is that the tuner can retune about as quickly as you can blink your eyes (the relays go "click", and its tuned!). Most convenient.

Hi
Does anyone have information about the internal construction of the Ft-51R batterys. The four terminals on the charge side do not appear to connect directly to the four terminals on the radio side. The radio schematic is not very halpful either. Aftermarket battery manafacturers have not been very helpful. Thanks for any help.

>It might be very interesting to find how the ICOM tuners fair; they've

I found the AT180 (the tuner specifically for the IC706) a bit problematic.
There are two small switches (inside the tuner, of course) which alter it's
behavior. If your SWR is 3:1 or less at the tuner OUTPUT, the tuner is quite
well behaved and automatic. If your SWR is higher, you get to change the
switches and use a different front panel procedure to activate the tuner.
(this requires opening the tuner, changing switches, and power cycling it).
I can see no valid reason for these different modes - the tuner should just
do "best possible job" and be done with it. Also on 6 meters (the band you
specifically asked about) the tuner has a much narrower tolerance for mis-
match - antenna SWR >3 or 4:1 will result in the tuner not staying online
at all, and the activation procedure (how you operate the tuner from the
front panel of the IC706 is different - read the manual!). All in all I think
ICOM did a very poor job designing the AT180, particularly given it's price.

Posted for a friend

The following Ten-Tec gear is for sale ;

Hercules 1KW amplifier, Model 420
Paragon Xcvr, Model 585
Automatic antenna coupler, Model 253
Power Supply, (14VDC@100amps), Model 9420

Paragon Xcvr was returned to the factory for firmware update (EPROM) and alignment about four months ago. Would like to sell as a complete station, but may consider selling amp/power supply or Xcvr/tuner combinations. Would also consider taking a Kenwood TS440 as a partial trade.

Asking $2900.00 for complete station.

Please contact Lynn (401) 849-1699 (Middletown RI)

>I made a quick check with a few folks up in JA....
>...
>this puts the Icom rig at under a thousand bucks USD.

>Just curious if this is unique to the USA or not.

You're right... start complaining about the price of Hamrigs in the
US. Maybe you should buy in Belgium! We pay AT LEAST 60% more for our
equipment than you guys do.
I don't know the 706 price in Belgium BUT here are a few references
you can check.

TS-850S 77.995 BEF ..... US$ 2600
TM-790 99.995 BEF ....US$ 3333

We have a salestax of 20.5% on this (already included).
By the way... the same goes for video, TV and other electronic
equipment. I've been in the US several times and if it wasn't for the
high importtax in Belgium (20,5% tax + 8% importduty) I think I would
have A LOT OF LUGGAGE upon returning home :-))

By the way, we're very lucky. Several years ago tax on 'luxery
articles (electronics) went down from 33% !!

My guess is that it's not the dealers who profit the most from the
pricedifference but it all has to do with TAX.

Hope this helps in your 'pricesurvey'.

73, Happy NewYear 1996.

151. Kenwood TS-870S Control Software Included

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: cliffor1@ix.netcom.com
Message-ID: <4ch7t0$igf@ixnews8.ix.netcom.com>
Source record: 207706

I am looking for any reviews on the control software that is included with the TS-870S. With all of the new features that the radio has, how much of it can be controled via the keyboard.

Kenwood claims that the software can control more than just the features of the radio and can even set the filter positions for each memory.

How versatile is the Radio Construction module. It would be nice to build your own radio on the computer screen and only use the features that you want or need. Operation can be as simple or complex depending on your needs. You can build different screens to accomodate your operation at the time.

Looking for your comments. 73

Hello all:

I am very interested in collecting mods, hints and tips on the older classic Ten Tec Argonauts, the 505, 509 and 515's. I have just two that I found in QRP Quarterly.

If you have, or know of, any published or unpublished mods or hints on the Argonaut 505, 509 or the 515, could you email me about it?

I plan to assemble it all into a short list of citations at the very least, then to put together a small article for QRP Quarterly. Those who contribute will have my undying gratitude, and I am happy to cover copying costs and/or return the favor from my own little library.

155. Looking for info to resurrect Heathkit H89 Morse maschine

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: rdkeys@csemail.cropsci.ncsu.edu
Message-ID: <4cgv2k$e7u@taco.cc.ncsu.edu>
Source record: 207710

OK, there, all fine hams, hackers of the old pfarte generation, and Luddites of ancient days who prefer a ``real computer'' youse can gets yer gemittenfingerpokins into..... A Happy New Year to youse all!

I am trying to resurrect a fine and ancient Heathkit H-89 maschine for one last hurrah on CP/M (maybe also HDOS if I can ever get its workings figured out.....(:+0}.....). My basic goal is to make it run my trusty, rusty Morse Code program with my trusty, rusty Heathkit HW-16 amateur radio station (what a way to combine computers and ham radio, right!).

Anyway, one of the internetters gave me what appears to be a mostly complete, somewhat modified, H89 (and on this one I actually have the boot disks....Yeah!). Unfortunately, the docs on it are a bit sparse. There is a strange National Technical School assembly manual, with no schematics, and little board level info, and not much else in the way of docs.

The machine seems to be a 64K model (has a H89RAM piggyback board installed on the mother cpu board). It has the original hard-sectored floppy card, a double density floppy card (I am assuming it to be a soft sector controller), a 3-port serial card (I am assuming it to be the LP card and two RS-232 ports [one DTE and one DCE]), and a hard disk controller card with the end cut off to clear the top of the cabinet where a very strange hi-res graphics system was installed) (the hard disk controller is a Micronics Technology board with a plain IBM ST-225 drive).

I need to undo some of the installations to remove the funny graphics system --- I have not the foggiest what it was or is. Also, I may want to just run the thing with floppies only, so I may want to uninstall the hard disk controller unless there is a major reason to want to keep it around.

So, I need to fill in the missing blanks, so to speak, regarding the removal of various added ``features'' to make it a stock H-19 terminal CP/M computer, again.

In Particular:

1. CPU Motherboard --- Board Numbers 181-3592 85-2549-1

Missing Chips - U502 (14 pin) --- ??? (dunno what goes here at all)

U507 (20 pin) --- ??? (maybe a 74LS241N ???)

U557 (16 pin) --- ??? (maybe just a header socket and
not a chip socket ???)

SWITCH Settings - I have no idea of what the proper settings are for a
stock machine. Any help is appreciated.

JUMPER Settings - There are 7 jumpers, but what is the stock configuration
or what do JJ501-JJ507 do?

2. TERMINAL board --- Board Number 85-2650-1

Missing Chips - U428 (14 pin) --- ??? (dunno what goes here at all)

U427 (16 pin) --- ??? (maybe just a header socket and
not a chip socket ???)

U423 (14 pin) --- ??? (dunno what goes here at all)

U420 (24 pin) --- ??? (dunno what goes here at all, but
the graphics system was plugged in
here. Maybe a rom goes here???)

3. Double Density Controller board --- Board Numbers 181-3614 85-2597-1

What connectors are floppy connectors? P3 and P4 are 34pin headers, but
which goes where? Are one or both used?

What connects to the 16 pin dip header socket P5?

What port is jumpered in a stock configuration (170 or 174)?
Are the ports related to the hard sectored controller?

What jumpers are jumpered in a stock configuration (mine has J6 jumpered
with J3 set to position 1 and j4/j5/j7 are open.

4. Serial I/O board --- Board Number 85-2715-1

What ports function as LP, DTE, DCE?

P603 = ???

P604 = ???

P605 = ???

How are interrupts jumpered for CP/M use?

LP = off?

DCE = 5?

DTE = 5?

Anyone who can fill in the above blanks, has my sincere appreciation!

The only problem I see on the hardware, other than resetting up the original chips to stock, is that the power supply bridge 4 pin plug connector is missing. The plastic shell is gone, but the pins are there on the ends of the wires. This may have been a problem with the previous owner. Can anyone recommend a source for the plug shell? If not I will just tack solder the wires to the ends of the pins.

One wire seems missing from the backmost connector on the power supply board, also. I have no idea what may have originally gone there. A schematic to the power supply board (the one with the diodes and capacitors) might be of value, as would a wiring harness schematic detailing where the wires from that set of plugs originally went.

Since I don't have much in the way of docs, can anyone point me in the direction of docs for the H-89, particularly schematics and board level docs and hardware setup?

Also, if anyone has any documentation on the Microns Technology Winchester Controller board, I would love to get a copy, if the thing can work with some reasonable expectation on CP/M, again.

I would love to get the beastie up on soft sectored drives (like a pair of late model 360K PC-AT drives or maybe even a pair of 1.4 meg drives acting as 360K clones. Can the dsdd controller be used as the main boot controller and the hard sectored stuff removed (once files are transferred and sysgennied to soft sectored disks)? Surely someone has done this along the way, in the deep dark aeons of CP/M time.

Also, what amateur radio related software is around, anymore for the machine. Surely there must have been a lot in the early days. Is anyone still USING such programs, lately?

Any general comments, hints, pointers, are also appreciated.

Many Thanks to the group, again....!

I agree with all of this as I too have an Alinco DX-70. The noise blanker has taken alot of heat lately, and yes it is less than ideal. But, turn it on and the impulse noise does go down. The objection that I have is that it tends to clip the audio peaks of people with high pitch audio, thus causing distortion. The second and I think major issue is the TX power on 6m. I talked to a technican at a ham store who claims that Alinco uses the driver output for 6m because the final does not work to 6m. For quite a long time 10w has been the standard on 6m, it seems that Icom caught Alinco "with its pants down" on this one. I saw a comment today that the fan runs most of the time on the Icom, well on the Alinco it runs rarely, and when it does is as quiet as a whisper. For me, the Icom has not been proven yet, and the $300-350 difference buys me other toys.

157. Icom 706 & CAP/MARS

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: kgk@nwu.edu
Message-ID: <kgk-0401961409100001@kgkmac.repoc.nwu.edu>
Source record: 207712

I don't think I've seen this question posted yet. Can the new Icom 706 be modified for CAP/MARS use, not only on 2 meters but also on HF?

I don't have any real info on this radio other than what I've read here or seen in the AES catalog and this group has provided some interesting information.

Thanks

Ken

>only available on the other mic?
Yes. The joystick mic has a full DTMF keypad on the other side.

>2) Is there a mod available for800-900 mhz receive??
I haven't heard of a 800 Mhz mod, but there is a simple MARS/CAP mod
that opens up the TX range to 137-174 VHF, and 410-470 UHF.
>
>Any other info or comments on this rig would be appreciated.
I just picked up an 8500 today, and from what I've seen so far, they
didn't leave anything out. Without the Windows software, though, I
think one needs at least two years at MIT to actually apply all the
features.

Since you didn,t state the model #, They could be anywhere..... Best thing (and least expensive) is to borrow a frequency counter and check it out. Don't be suprised if you can't find the right PL tone on your Standard. HT-600's have non-standard and digital PL's.
Good luck.....

From: Gary Davidson <Reporter@sparc1.castles.com>
Message-ID: <4ch2kq$sfq@miwok.nbn.com>
Source record: 207719

Interesting to note that for the most part, foreign countries pay FAR MORE
than we do in the U.S.A., mostly due to extremely high taxes applied by
their respective governments. Also note that these high tax rate ALSO
apply to just about EVERYTHING these folks in those countries purchase.

Why is this interesting?

Because of the large groups within the U.S. who would like this country
to be MORE like those foreign countries.

Then we could pay more for:

clothes
gasoline
food
housing
utilities
entertainment
automobiles

.. and just about anything else you can think of!

GEE... I can hardly wait to be more like THEM, how about you?

166. Re: What's a "Boatanchor"?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: azoth@netcom.com
Message-ID: <azothDKoD7B.3un@netcom.com>
Source record: 207721

I heard JT (jamest@netcom.com) say:

: Just out of curiosity, what's considered a boat-anchor?

There are possibly as many working definitions of 'boatanchor' as
there are lovers, and denigrators, of same. Most revolve around an
appreciation of thermionic technology, but although I grew up with
them and was actually trained in their handling, there _is_ life
after tubes, and I consider this view unnecessarily narrow. So,
you might say that there are both orthodox and reformed boatanchorites
(kinda brings to mind an image of some old fart camped out in a crude
desert hamshack, waving his D-104 in blessing at a glowing KW-1...)

I would suggest: any device larger, heavier or more demanding of power
than is necessary to accomplish its function, given the current state
of the art, by at least one order of magnitude.

I would also suggest that context, and an honest definition of function,
also matter. For example, 'portable shortwave receiver' is a functional
description of a large class of very light, small, battery-efficient SW
radios currently available to consumers. By the above definition, _any_
TransOceanic, hollow _or_ solid state, is a true boatanchor by virtue
of size, weight and power consumption. My GR-78 also qualifies, IMHO, by
weight alone, as it was also billed as a portable, and with batteries
weighs probably 12-13 pounds. It's a _sturdy_ portable. ;-)

Most hollow-state radio gear clearly meets the criteria, but much early
solid-state equipment, like the HRO-500, does also, compared, for example,
to something like an FRG-100 or Lowe 225. Putting Tubesters in a 75S-3C
doesn't make it _less_ of a boatanchor, either. My JRC twins altogether
weigh in at 30 or 40 pounds, consume not much less than 100 watts at
idle, occupy a 13"x15"x24" space and provide the functions of a 100w
HF SSB/CW transceiver. It is completely solid state, but is absolutely
a boatanchor by comparison to something like the 706, 890 or even an
'old' FT-757 or IC-701. It's also more aesthetic and fun to operate,
but that's the other side of the boatanchor coin, and not so easily
measured.

IMHO, function, form and fitness make a boatanchor, and not simply
the absence of air in some of the active devices. The big Sony monitor
sitting in my living room might _work_ as a boatanchor, but it doesn't
qualify, since it's not far from the state of the consumer electronics
art, despite having more vacuum than all my Drake, Collins and Hallicrafters
bottles combined.

168. Re: Manuals for FT-5100

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: tbaltz@neosoft.com
Message-ID: <4cgt9e$hca@uuneo.neosoft.com>
Source record: 207723

The 5100 has only one manual. Mine came with a slip of paper expalining how to set it up for cross band repeat:
1. Tune both desired frequencies, tones, power levels in on each band.
2. Turn radio off
3. Turn back on while holding the RPT button.

The display will replace the first digit of the freq with a R. To turn crossband repeat off, turn radio off, do steps 2 & 3 again.

No idea why Yaesu didn't include this function in the manual, but noticed that Icom did the same with my dualband HT. Perhaps crossband repeat is illegal in some countries?

Also scan the mods files at the ftp sites (QRZ or Buffalo). You WILL want to do the mod to have the cooling fan on all the time - I didn't, it cost me my finals running too hot. Also explains how to set up the front panel light/dimmer much better than the manual.

I couldn't believe I had this issue of 73 right in a small pile
at my fingertips. Your description of the problem plus a
perusal of the schematic makes me suspect some "squirrelies".
I note the COS input line is bypassed with C3, a .22 uf
capacitor. Is this in place and is it close to U4? If it is,
I recommend the following:
-Try installing .1 or .2 uf capacitors physically close to pins
4&5 of U3, pins 9 and 10 of U3, and pin 27 of U1.
-I don't see it in the circuit but all your IC's, especially
the logics (U3 and U4) should have the VCC pins bypassed with a
1 to 1 uf or so electrolytic mounted as close to the IC's as
possible and with as short a connection to circuit ground or
the IC ground as possible. I'd suggest this as your first
priority.
-You may also be experiencing RFI from your attached
transceiver. It probably should be mounted in a good rf-proof
box with incoming and outgoing wiring bypassed and/or choked
with ferrite shells and other RFI reducing techniques.
Good luck with the project. Hope some of this helps!

177. Want to build 2meter power amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: by668@FreeNet.Carleton.CA
Message-ID: <DKn1qn.Asq@freenet.carleton.ca>
Source record: 207732

Hello and thanks for reading this, I'm looking to build a power amplifier
for my 2 meter rig, anything from 100 to 250 watts of outputs
and inputs of 5 25 of 50 , that is what comes out of my radio, anyone who
would be interested in mailing me some papers and stuff to help me I would
be very thankful, (if the photocopy of the negative for the printed circuit
is availlable it is welcome too)

Waiting you e-mail soon, please stick to e-mail, the posts I dont read often...

Thanks
Marc Buron

>it pegs the needle. It should not be that sensative. It is not the
>mike. Does anyone have any suggestions?? Thanks.

The two 940's I have experience with do the exact same thing. I
think it was by design. I could never get the ALC to settle
down unless I used the RF processor, then I could level it out.
AND, the ALC reading "drifts" with time, too, by a bit. I never
had any bad audio or wide signal reports, so I suspect the
readings do not mean much. I used to use the RF processor on
very little compression, and kept the ALC in range that way.

Ke> I am interested in peoples experiences with the two radios???

Ken I bought both radios ay my last dayton trip 95 to let you know the
kenwood is not all its kracked up I sold it after two months I found the
yeasu out performed it and with the software program that alows you to
progam the 51 from your pc is the best. cross band repeat functions and dtmf
squelch is all good functions of the 51r and it seemed that the intrmod on the
51r was less in all most all situations. The 51R for me has been flawless
and I am not easy on the radio I use it for ham and buisness on my licenced
frequency it is easy to mod and work well out of band and I mean good even
inthe GRMS area which is in the 462MHZ I also have a current site licence for
It kills the best of them {motarola} the keen wood was not a keeper.
By the way It is A tough radio with the factory batt (hipower) use it everyday
since the april and charge at night gives me about 3 hours of talk time, and 10
hours of ON time with good use thought the day. the keen wood did not stand up
to this raido. good luck Its My Oppinion and we Know how they come and GO!

My old SGC-230 and new IC-706 seem to be getting along fine. I recommend using the RTTY setting to drive the SGC-230 to tune. There does not seem to be a handy way to get the 706 to do CW with the PTT switch. If you use the up-down buttons as a CW paddle you can't use them for any other function. The 706 will go to low power faster than the 230 will tune so 25 watt AM won't provide enough power to let the 230 sense SWR. Dumb but the up down paddle is a cute idea.

>I am a licensed amateur operator. How high may I legally put up an
>unlighted tower without offending the FCC or the FAA? I live in eastern
>NC about 20 feet above sea level. I am outside of the military
>air-restricted zone. Also, does anyone have the number or address for
>Roadrunner Communications?

Provided you are at least 4 miles from the nearest airport, you can
erect a tower up to 200 feet AGL without incurring a FCC major action
or requiring a filing with the FAA. That is unless you are in sight of
a National Park, Mounument, National Seashore, or declared Historical
District. In those cases, much more restrictive rules apply. Lighting
and marking may be required in some cases for antennas of less than
150 feet height, see CFR 47 Part 17.21. In almost all cases, lighting
and marking are required for antenna structures over 150 feet AGL unless
totally obstructed by natural terrain.

189. SIMPLE SIMPLEX REPEATER....HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: tcmedlin@cris.com
Message-ID: <4cf79j$559@spectator.cris.com>
Source record: 207841
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I recently built the simple simplex repeater as described in 73 Amateur Radio Today, nov 1995 issue but i have one problem that i need help resolving. if the receiver receives a signal for about one half second or less, the simplex repeater keys up for the entire 20 second period then drops out. any received signal more than about a half second operates it correctly. example: if the receiver receives a signal for 5 seconds, after the rec signal drops, it then retransmits this signal for 5 seconds and then resets or drops out. it is only the very quick keying pulses that lock this thing up.

the repeater is based on the ISD1000A voice record/playback IC which can be found at radio shack and about 30 simple parts. this chip is designed to record a maximun of 20 seconds.

there are 2 rc delay circuits which i have tried to adjust but this does not seem to help. I dont think the problem is power related as i have a good supply, and plenty of filtering and bypassing on it.
If anyone can help, please email me at tcmedlin@cris.com

thanks,
Tom WA5KUB

195. FM BC reception on 706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-04 00:00:00 UTC
From: rcarpen@DGS.dgsys.COM
Message-ID: <Pine.SOL.3.91.960104060940.6359C-100000@DGS>
Source record: 207847

WB5AGF states that ICOM doesn't spec the 706 on the FM BC band. WRONG!
Look on page 55 of the manual. Under WFM you will see "Less than 10.0 uV"
"(for 12 dB SINAD)" and "*Some frequency ranges outside of the ham bands
are not guaranteed."
So, ICOM does spec the FM BC sensitivity, but does't guarantee it. In
fact the bad intermod on FM BC makes this spec meaningless.

My interest in have acceptable FM BC reception on the 706 is so that it
could be the ONLY radio in my vehicle or boat (except for marine VHF on
the boat).

A single tuned trap at the VHF antenna connector, set experimentally to
some strong FM station, brings the intermod to the point that my 706 is
useable for FM BC. I assume I would need to retune the trap as I mobiled
around town. If it had two FM BC IF filters of the 180-200 kHz width
required by good engineering practice (not just one of 280 kHz plus with
broad skirts), it wouldn't suffer so much QRM from adjacent channel
stations.

As for substituting the feature of synchronous AM detection for FM BC
reception, I presume that the "features czar" at ICOM felt that FM BC
would serve them better in a bells and whistles battle.

: I'd like to find a fast charger that would be good for AA size NiCad
: cells, including those high capacity ones you can get at rat shack.
: I would like one that could do 8 cells at a time. Any suggestions?

Hello David, I am currently using the "MILLENNIUM Power System" for a Uniden scanner which takes AA batteries. I purchased the AA's 4 years ago and have used them (discharge/charge cycle) once a week ever since then. I have two complete sets of batteries and also two 4-place chargers. I was impressed with the amount of power/run time, so I purchased millennium batteries for many other items around the house.

The Millennium AA's that I have are rated 750 mAh and some Panasonics that I saw recently were only rated 500 mAh. I am not sure about the high power Radio Shack version.

You should also know that even though the Millenniums are of higher capacity than most, they still all die about the same... Suddenly :)

Please let me know if I can be of further assistance, I would be glad to help you any way I can.

Too complicated. A 'boatanchor' is any piece of electronic equipment, most
notably transmitters and receivers, heavy enough to be a servicable
anchor, and old and worthless enough that you wouldn't mind using it as an
anchor.

214. Wanted - Circuits or manual for HP sig gen type 608E

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-05 00:00:00 UTC
From: andrew@redash.qut.edu.au
Message-ID: <4cj5nc$l58@stork.qut.edu.au>
Source record: 207754

Hi
I need a circuit diagram or preferably a full service
manual for a Hewlett Packard VHF signal generator
type 608E - 10 - 480 Mhz - serial no 833-03128. I appear to have
a problem with the ALC section. Main osc is running and
there is 2v pk on un-cal output but neglible output from
attenuator. Probing shows very low level sig into driver stage.
If you have a copy of the circuit diags or a full service manual
I am willing to pay whatever costs are required to get a
copy to Australia !

Thanks in advance... Steve

Does anyone have a suggestion on where to obtain the Service Manual for
an H-P 8620C. I find that after lying unused for 6 months mine is now
stone dead except for the illuminated power switch. Even the fan is off.
Are there any other fuses apart from the line fuse near the IEC connector
or will I need the schematic of the PSU?

Also, has anyone married an 8620C (eg with 86290B) to a Tek 7L18?

There is an automatic shutdown circuit in the 8620A/C that puts the
unit in the state you describe if the fan does not start or fails
for some reason. I had an old fan with bad bearings that would not
start and, as a result, caused the instrument to shut down after
a second or two. This might be your problem.

There seem to be more mainframes around than working plug-ins for them.
I have found it convenient to buy a junker for parts to keep my good one
going.

Sorry, I have no manual for mine either.

>additional ones. I would appreciate any info if anyone has tried it;
>What's the new TX range? Thanks: DL

Yep, I did that this past summer, and I just got around to testing the TX range a few weeks ago. The TX range is about 121.71 to 190.16 MHz and 380 to 472 MHz (VHF/UHF, respectively). These tests WERE carried out in a proper testing environment, with miniscule amounts of power actually being radiated. The frequency and power output were verified with a spectrum analyzer. Although I did not record the actual relative power at all the frequencies tested, I CAN tell you that the power tailed off toward the extremes. Beyond the extremes, the transmitter lost lock (the transmit LED will blink on and off), so I stopped at these frequencies.

Overall, the modification took less than an hour, and most of that time was spent trying to figure out how to hold the diodes in place (they are SMALL, be careful). Use a pencil tipped soldering iron, as small as you can find. This will make it much easier.

Be careful, and good luck!

The software and interface cable are extra, but reasonable at $40.00.

>Also, does the rig come configured for remote mounting the head or is that
>yet another additional option?

The remote cable kit is also an extra, at a not-so-reasonable $100.00.
It has extensions for the remote head, as well as the mic. The promo
literature by Yaesu on this radio covers all the options.

It depends on what you are looking for. Are you looking for an HF rig, or a UHF/VHF rig? Mobile or base station? What class of
license do you have? This will better inform people on what might be of use to you. 73 de N2YZS

226. Re: MIKE FOR HEATHKIT HW101

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-05 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4cjc68$r4c@mksrv1.dseg.ti.com>
Source record: 207766

The HW-101 manual describes the mic connections (actually, all of the older Heath rigs used the same connections). All of the HW- and SB-series tube-type rigs use a high-impedance mic, and I've found that the Astatic D-104 (the infamous "lollipop") is a good choice, as is the Shure 444. The original Heath mic is actually an Electro-Voice, and E-V sold the same mic on the open market with their emblem on it.

Now... if someone has changed the mic connector on the HW-101, you'll have to trace out the wiring to determine the connects. You can find this info in the schematic. The mic connector that Heath used is an Amphenol unit, common back in the 60's but not any more. I've seen dozens of Heath rigs that have a more common four-pin mic connector. This is okay, as long as the changed wiring is documented in the manual (and on some kind of label inside or on the bottom of the rig).

If you don't have the manual (shame on you!), I have one that you can borrow and copy.

As for finding an original Heath mic, good luck pal. I have an SB-102 that I'm restoring and I've been advertising for a mic off and on for a couple months with no responses.

Let me know if I can help. 73, Dean KC5NG

On HF, absolutely. Just remove diode D59 and reset. On VHF, not yet.
Removing D59 will allow it to transmit out of band on VHF too, but
power is reduced to about 1 milliwatt. Something else needs to be
done to prevent the foldback circuitry from being activated when
outside 144-148 MHz. We should discover that fairly rapidly when
the service manual becomes available.

The assets of Gates Energy Products, who owned the "Millenium" trademark,
were purchased by Eveready some months ago and those products are no
longer being produced. Some stores near me had close-outs on remaining
stock of this stuff over the summer.

Eveready once produced a 1-hour charger ("Generator") but it failed
commercially.

Anyone know of a rapid charger that ***PROPERLY*** charges invidual NiMH
penlite cells?

242. SIMPLE SIMPLEX REPEATER.....HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-05 00:00:00 UTC
From: tcmedlin@cris.com
Message-ID: <4ckdsh$pjc@spectator.cris.com>
Source record: 207782
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I recently built the simple simplex repeater as described in 73 Amateur Radio Today, Nov 1995 issue. I have a bug and need help with ideas which may correct the problem. this simplex repeater is built around the ISD1000A voice record/playback IC that is available at radio shack. It has a max recording/playback time of 20 seconds. there are only 2 other simple flip-flops and a few other parts. This repeater should receive any transmission up to 20 sec, then rebroadcast that. It does that and the audio sounds good. Now here is the problem: if any received signal comes in for about one-half second or less, it then keys up the transmitter for a full 20 seconds before it will send the EOM end of message reset. this is not good because a short static burst or quick keying of the mike will lock it up for 20 sec. It functions normally of any signal over 1/2 second and up to 20 seconds. I dont think it is RF because I can manually key it up by manuall changing the voltage on the COS line and it still hangs up for 20 seconds. Does anyone have any ideas? Please email me if you can help.
thanks,
Tom, WA5KUB

>Jim KB8YVN from northcentral West Virginia.

Love the HW101s, mine is still going strong, built in 72.

The mike is easy, ground is the ring, audio is pin 1 and ptt is pin 2,
even if you get it backwards and have to change it, it won't hurt
anything.

Hello Gang,

I've got some telegraph key restorations going and need a few parts to
finish up.

1. Bunnell Gold Bug -- need the circuit closing lever and mounting hardware.
2. McElroy A-400 bug -- need thumbpiece and weights. A-400 or P-500 parts OK
3. Signal Electric Semantic -- need the pendulum stop post.
4. Electro Bug -- need weights. need one thumbscrew and jam nut.
5. Levinson Radio "Like-A-Flash" -- need finger pieces, binding posts.
6. Logan SPEED-X reverse frame -- need finger pieces
7. Clapp-Eastham -- need binding posts
8. Independent Wireless -- need binding posts

Would buy parts off your junkers or buy your junkers for the parts.

Does anyone know what happened to DX Solutions?
The made a fabulous control unit for automatic selection of antennas, controlle by the digital "port"s, that most transceivers have today: ICOM, e.g. made a mistake when decidin on their antenna selecting system. the IC 726 santenna-selector is OK if yoy work the same antenna on 18/21 and 24/28 - but how many do that.
The DX-solutions "Smart Antenna Selector" can select: 2 antennas for 80 (high/low) - one for each of the other HF-bands. Temporary manual selection very quick.

>one to work with this radio. I want a desk mike with vox. This radio is
>super. It is my first HF rig and I love it! Anyone can help?
>Jim KB8YVN from northcentral West Virginia.

Hi Jim:

Do you have the manual? You really need to have one. It will explain
the mike wiring. I also believe that VOX is built into the HW 101,
so that wiring according to the manual will get you there.

I believe I used a cheap crystal mike with my 101. I got one from a
CB guy for real cheap. You might try that. But the manual for the 101
is the key. If you want, you can put out a "want ad" on rec.radio.swap
and you would probably find one. There seem to still be a lot of 101's
out there! Yes, pretty darned good radios for their day, and even for
the money today.

Aerotron should still be around, been awhile since I have had any contact with them.
Try the following:

P.O. Box 27500
Raleigh, NC 27611
Phone 919-827-4400

Or call the Tech-Net BBS at 423-235-3564 (2-Way radio bbs) and someone on the bbs should
have
info.

Thanks,
Jim KD4LP

Source record: 207610

Hi John!
Believe it or no - I have tried the 706 with both the SGS and the AH3-tuners!
I made a little control-box for the SGS - just to make it "smarter"!!
Both work UFB - BUT, none of them on 50 MHz!!!
The only auto-tuner that works on 50 MHz also is the matching AT 180!!
That one works UFB also.
The SGS is OK if you want to work ALL kind of antennas with different rigs.
The AH 3 is the natural choice if you want to work ALL antennas with the 706.
YThe AT 180 is the right choice if you want to work "nearly OK" antennas with the 706 - the impedance matching range is limited to approx 3:1.
The 706 is giving a lot of fun in a small box! have had it since september 95 and worked on all kin of antennas - from fishing-rod to 2 el Quad!!

Hi, Mark.

There is a 13! pin DIN accessory socket (and a plug supplied!) that looks like it can be used for 1200 bps packet. The only audio input is pin 11, which is labled "modulator input," 10kohm impedence. Pin 12 is labled "AF detector output, fixed, regardless of AF position." Squelch output, PTT, full-time 13.8 VDC and other signals are also on the connector.

But, I have not tried it...

>that I found in QRP Quarterly.

The biggest improvement you can make to these radios is to replace the solder coated Molex pins in the harness with gold flashed pins. That will remove the chronic intermittants these rigs are prone to experience.

The chronic levels of SO2 in our urban air quickly tarnish the solder coated pins and cause intermittant problems. Often a good whack on the top of the radio will temporarily allow it to continue working. If you are experiencing this type of problem, simply removing the cover and exercising all the connectors will usually cure it for a while. But the better fix is to replace the pins with gold flashed pins.

>My only complaint is that there appears to be a noticeable alternator
>whine, whereas my previous IC901 did not have one, time to make a
>filter :-(.

I have one other complaint. I am not happy with the options for
Automatic Receive Mute when there is activity on both bands. It appears
the only options are to ALWAYS MUTE the VHF OR ALWAYS MUTE THE UHF.
It seem the logical option would be to ALWAYS MUTE THE BAND THAT IS NOT
CURRENTLY SELECTED (i.e. the sub-band). That is what they did on the
FT-51 R and it works great when you happen to be talking and someone
starts talking on the other band. To add insult to injury, if you try
to mute the annoying band from the microphone mute button you discover
that it mutes BOTH bands.

Have you tried HP. I've purchased photocopies of old HP gear direct from
HP. It's not cheap, but it is reasonable. I don't have the number
handy, but if you have trouble finding it email me, and I'll look it up.
HP also has a web site that probably has phone numbers.

Slam dunk each of them onto a concrete floor, measure how high
each of them bounces. The one that still works will be the
Motorola. :-)

Now what the heck do you want to test them *for*, IMD performance,
power output, most Gameboy features, what? Depending on what you
want to know, different tests will be required.

I used "CODE QUICK" and loved it. I subsequently passed my tech +
exam now preparing for my general exam. I did notice the unfortunate
price increase (from $29 to $42), but knowing what I now know, I
think that its worth it. I found the usual tapes to be extremely
boring but not these.

If you want to use a computer for additional practice I would
recommend "Morse Academy". It is excellent freeware.

You are wrong ! Any sales person regardless of who they work for have
the obligation of being as pleasant as possible to all customers.

Being snotty and unpleasant does nothing for customer relations not to mention the company they work for. If they cant be pleasant and helpful then they have no damned business being in the sales field. I am the service manager for an alarm company so believe me I know about customer relations and what some of these ham radio dealers exhibit is far from good customer relations.
Do you like talking to someone who has a chip on their shoulder and who talks down to you ? No, I dont either and if I get those kind of "vibes" I take my business elsewhere.

My opinion is also my own but DOES reflect those of my employer !

Correction: freq is 145.7625 (2.5Khz off..)

In Brussels you should be able to receive the Antwerp repeater and
145.675 (brussels), 145.700 (Ghent). Depending on your excact location
you might hear the Verviers repeater on the same frq as the on
Antwerp.
As for Simplex, try 145.500, 145.550 FM usually you can hear something
there. 145.550 might even get you Spacestation MIR when in reach. I
hear MIR 9++ in my car on a 1/4 wave antenna.

>tsimpson@iglou.com

A combat aircraft would not have carried a civilian ELT; you don't want
just anybody to find the crash site (especially before you do). PRC is
the designation for backpack size communications radios (for example, the
PRC-54 (?) was the standard issue VHF radio during the Vietnam era). A
pilot would have a rugged handheld URC-type radio as part of his survival
gear (carried in his vest). These types of radios can be used in beacon,
voice, or silent (CW) modes. I also think the newest ones have encryption
capabilities, making it even harder for the bad guys to listen in.

Actually all aircraft Military & Civilian do carry ELT's. Also alot of
the Army's aircraft also carry "black boxes" that traditionally have been
installed fleet wide after a mid air collision of some type by the same
type of aircraft. Also I believe the ELT's the military use are on a
different Freq than the civilian versions.

They carry them so that they can be found a lot easier by friendlys.
Also alot of the ELT's are mounted in the airframe where you cannot
get to them to remove them anyways.

And yes I now what PRC stands for. (Damn Prick, Damn Prick). BUT like I
said the though MOST PRC's that I have come into contact with don't have
more than a 20Km range anyways. And IF you are in a valley, forget about
it. Also I don't know what I'm talking about I've only been a Blackhawk
crewchief for , OH about 7 yrs. now

The PRC-90 is an HT sized, personnel radio carried by Navy Aircrew in
the 80s, early 90s. They were to be replaces by a PRC-1xx (I don't
recall the numbers), I did not see any, nor did we receive the test
equipment for when I got out of the navy in 1993

300. Wanted: Manual for Heath HD-15 Phone Patch

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-07 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4cpdnf$e2p@cville-srv.wam.umd.edu>
Source record: 207640

I have a Heath HD-15 phone patch; it's the older Heath Green,
and I don't have a manual for it. Can anyone help?

Thanks!

yes, i have used heathkit hw101, ans a yeasu tempo one for years. they
are cheap and work well. they are tube tranceivers. if you wany solid
state, almost any older kenwood or yaesu will work fine. i used a
kenwood 520 and it was both cheap and worked well.

I'm new to radio and have been to AAR several times to learn about equipment and such. Each time I was treated with very rude and arrogrant attitudes. It was as if I didn't know enought to be talking to them. What a terrible way to treat new potential customers! I don't think the manager cares cause he was one of the rude ones. I will buy all my equipment throught the mail and i live in Austin.

I am looking for information about the protocols used by Lowe, Drake, Japan Radio, and AOR radios for their computer interfaces. I plan on modifying the shareware Macintosh radio interface software I already have for Icom rigs. (Kenwood and Yaesu versions are already under development)

If anyone has copies of the protocols for these radios, I'd appreciate getting a copy, or finding out where I can get the information (is it online?)

Thanks,

Chris

I am planning a purchase of a new dual-band HT.

I have seen plenty of comments on the Yeasu and Kenwood
offerings but haven't seen much on the Alinco DJG5T.

Anyone have any comments on it? Mods?

Thanks,

Jeff Goebel N0VHB <jgoebel@rrnet.com>

306. E.M.C. MODEL 206 TUBE TESTER CHARTS WANTED - tube.001 [1/1]

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-07 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <4cp67g$i3u@csu-b.csuohio.edu>
Source record: 207646

Hello,

I am seeking photocopies of tube reference charts or tube reference roll charts (they're on two spindles inside the machine that show thru a user's window on the machine with a thumb dial to move it up or down to a tube on the list) DESIGNED TO BE USED EXPRESSLY with an Electronic Measurements Corp.'s product, an E.M.C. Model 206 mutual conductance tube tester.

I will take photocopies of your original charts and am willing to pay a fair price -- they need not be on the spindles, on just plain 8 1/2 by 11 white paper. If you do not wish to make the copies, you can send them and I will photocopy them and return them with a check in payment for their loan, plus two way postage expenses.

I just bought this used, do you know if this machine which is at least 30 years old can do the following tubes if the charts are available for it for the proper machine settings for the respective tubes?

I am looking for the charts for this machine that cover guitar amplifier tubes such as:

Columns #1 and #2 are the most important.

column #1 column #2 column #3 column #4

7027A 6550 5V4 6CA4
7591 6L6 5Y3GT 6CG7/6FQ7
7199 6V6 6267/EF86 6DJ8
12AX7 & 12AX7A EL84 6922 6EU7
12AT7 GZ34 6AQ5A 6EY6/6EZ5
12AY7 EL34 6AT6 6GW8
12AU7 5U4GB 6AU6 6K6
12DW7 ECC83 6BK11 6K11
6CG7 7025 6BM8 6SC7
6AN8A KT88 6C4 6SJ7
KT99 6H6 6C10 6SL7
6X4 7189
12BH7 OC3

I am a complete novice at electronics, but wanted a tube tester to check my amp tubes. I don't even know how to use the machine yet, although it has the operating instructions manual with it at least.

Is this company still in business or making the same/similar model?

Thank you and please email me with your pricing or any info as to where I can get these tube charts, literature, parts, etc. related to this tester. It is appreciated.

Lance

307. For Sale: RFConcepts 4-110 440Mhz Amp

309. Icom 706 hand mic. (More)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-07 00:00:00 UTC
From: rickcrider@aol.com
Message-ID: <4cpc2h$4f7@newsbf02.news.aol.com>
Source record: 207649

All:
I just recently posted a query regarding the unusual design of the Icom 706 hand mic, the HM 103. Didn't seem to generate much interest. Surely amongst all the 706 chatter someone out there has experimented with the metal and rubber disc arrangement inside the mic. I've heard three versions: (1) Remove the metal disc, (2) Remove the rubber disc, and, (3) Remove both discs, for improved mic performance.

Surely Icom didn't throw in these two pieces without reason.....any further thoughts or ideas out there? Could this be the source of the 'tinny' or poor audio and mic gain that some have mentioned? Thanks.

Cordially:

Source record: 207651

For Sale:

ELECTRO-VOICE #664 Variable-D* Dynamic Cardioid Microphone,
Variable Impedance Wired HI-Z, with original box. Has boom
mount attachment (permanent) and includes adjustable boom
(Appears to have been made from an adj. desk lamp base).
Appears to be in VG-EX cond. Cable also included.

I don't know the value of this mic and would appreciate your
input or offer.

Thanks for your consideration,

Steve

312. Power Supplies For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-07 00:00:00 UTC
From: steveclby@aol.com
Message-ID: <4cp09a$t7h@newsbf02.news.aol.com>
Source record: 207652

For Sale:

(2) ELPAC OLV30-12 Power Supplies, 12v, 4.0A (Adj. 4v,6A.
to 28v, 1.7A.) With Remote Sensing, (Instructions/Spec. Sheet
Included)

Guaranteed Specs:

1. Line Regulation: +/- .1% Output For
+/- 10% Input Variation

2. Load Regulation: +/- .1% Output for No Load
to Rated Load

3. Ripple: .1% P-P Output For
No Load to Rated Load

4. Ambient Temperature: 0-55 degrees C

Input: 120vac or 240vac

I'm selling the (2) units together. One has been wired for
120VAC and is putting out 12V. The other unit appears to have
been worked on and the AC cord has been removed. It may or
may not work, so I'm selling it as is. $25.00 plus shipping
for both.

Also available:

Variac V10-G3/POWER SUPPLY in steel cabinet with whisper
fan and Simpson DC volt and amp. meters. Marked "General Radio"
on handwritten tag inside case. 115v. Input 10a. 50-60 ~
I checked the output with a meter and it seems to range
from 1 or 2v. to approx. 30v. Dial is calibrated from 0 to
130. It appears to be set up as a battery charger or transformer
as it has (2) heavy output leads with battery style spring
clamps. $75.00 plus shipping (heavy)

Thanks for your consideration,

Steve

Normally HF is 3-30MHz.
3-3MHz is MF (meduim wave)
30-300MHz is VHF
300-3000MHz is UHF.
etc etc

There are however many sub-bands within these bands ie p-band,
L-band..etc

There are also apparently a whole new list of names for every thing
!

From: cn1290@coastalnet.com
Message-ID: <4cnkn5$l3@treasure.coastalnet.com>
Source record: 207660

I have been repairing PRC-90's for almost 15 years now. These are still the most widely used radios in NAVY and MARINE aircraft. I also have 500 hours as an enlisted aircrew member and carried one of the radios.

PRC-90's transceive on 282.8 and 243.0 (guard) with modes of am voice and MCW for code. 243.0 Mhz also has a dual tone swept beacon mode. Power out put is about 225 to 300 Milliwatts on average. Those are the basics. Have QA'ed and repaired hundreds of these things over the years.

As far as ELTs on tactical aircraft... They do not carry them. Naval aircraft do a beacon the uses the same dual tone swept beacon the the PRC-90 uses. It is automaticlly activatied upon seat ejection. For recovery purposes, the aircraft us an ultrasonic pinger with a saltwater activated delayed switch.

Saying any more would not be smart. I do not know what O'Grady was using but, knowing the Air Force it was probaly a newer version of the same old thing.

Buy the way I work now as an electronic warefare tech and I daily train F-16c and others on electronic warefare tactics and I will say Scott O'Grady was not trained here on our EW range.

Bye and have a good day.

WB3U (jackl@pinetree.microserve.com) wrote:
: retains an S-meter with the red Swan "S" insignia. Perhaps someone
: with the predecessor to this rig (Cubic Astro 102BX) can tell you
: whether that rig was also devoid of the Swan name.

I owned the Astro 102BX for about 9 years and just recently sold it. It was as SWAN Astro 102BX and not Cubic. For it's day, it was an excellent transceiver. It reminded me of the Ten-Tec Corsair in many ways. It used dual PTO's, red LED display for frequency and had excellent QSK with no relay. It's biggest shortcoming was the cw filter. The rig had "passband tuning" and allowed one to narrow down the IF by turning one knob. A row of LEDs indicated the width of the passband. There was a 2 pole crystal cw filter in mine that was virtually worthless. Blow-by was so bad that it really sounded best with the cw filter turned off and the passband set to it's narrowest position. Cw was a pleasure especially the QSK. It was lightning fast. SSB transmitt audio quality was beautiful. I used a D-104 mic and people would break in just to ask what I was using for a rig!

The main difference between the Swan and Ten-tec was the construction quality. Swan's circuit boards were heavy glass type boards and their components appreared to be Mil-spec type stuff.

When the Cubic Astro 103 came out, the WARC bands were added and a better cw filter was available. This rig was expensive for it's day being almost $900.

I think the little Swan 150 is the one with "electronic tuning" where you must hold a knob as the frequency changes much like the newer car radios. I find that very hard to live with.

I had another station listen to my signal while I adjusted it. Also, you
may try transmitting into a dummy load while listening on another
reciever. Try to adjust it so that your voice is boosted but so it
doesn't pick up a lot of background noise ie. fans etc.

Message-ID: <4co2tv$mav@hgea01.hgea.org>
Source record: 207669

Hi Megan:

The Motorola HT-10 is also known as the RADIUS P-50. The HT-10 is a crystal controlled radio. There are two chargers available for this unit. A 10-hr and a 3-hr. Recommend you post a WTB under Rec.Radio.Swap.

You can try a ftp to oak.oakland.edu and see. However, I've also heard that
the HTX-202 cannot be modified to RX/TX outside of the 2m amateur band.

337. DESPERATE IN CLEVELAND - NEED TUBE TESTER INFO - tube.001 [1/1]

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-08 00:00:00 UTC
From: l.mclaughlin@csu-e.csuohio.edu
Message-ID: <4crjpp$osb@csu-b.csuohio.edu>
Source record: 207560

From: l.mclaughlin@csu-e.csuohio.edu (Bostonian in Ohio)
Subject: DESPERATE IN CLEVELAND - NEED TUBE TESTER INFO - tube.001 [1/1]
Date: 8 Jan 1996 17:20:57 GMT
Organization: Cleveland State University
Message-ID: <4crjpp$osb@csu-b.csuohio.edu>

I am in search of information on the following tube tester:

1) EMC Model 206 Dynamic Mutual Conductance/transductance Tube
Tester - a dinosaur. EMC stands for Electronics Measurement
Corp. I want to be able to test newer tubes, if possible.
Please advise if it is not with this tester. It has a tube
chart for the older tubes.

The information that I seek is or any advice you care to offer
for sources of this info:

1) Schematics & servicing, calibration, parts lists info
2) Operators manuals
3) Tube setup sheets
For 7000 series tubes (especially 7027A, 7591, 7199, 7025)
6550 series & up tubes (especially 6550)
12DW7
12AX7A (it has a chart for a 12AX7)
EL84
EL34
ECC series tubes (e.g., ECC83)
KT88
GZ34
4) Broken units for parts
5) Any other useful info

Thanks
Lance

I have run the following posting with no luck on the boards
I could find as follows in modified form:

Hello,

I am seeking photocopies of tube reference charts or tube
reference roll charts (they're on two spindles inside the
machine that show thru a user's window on the machine with a
thumb dial to move it up or down to a tube on the list) DESIGNED
TO BE USED EXPRESSLY with an Electronic Measurements Corp.'s
product, an E.M.C. Model 206 mutual conductance tube tester.

I will take photocopies of your original charts and am willing to pay a fair price -- they need not be on the spindles, on just plain 8 1/2 by 11 white paper. If you do not wish to make the copies, you can send them and I will photocopy them and return them with a check in payment for their loan, plus two way postage expenses.

I just bought this used, do you know if this machine which is at least 30 years old can do the following tubes if the charts are available for it for the proper machine settings for the respective tubes? (I've noted them above already.)

I am looking for the charts for this machine that cover guitar amplifier tubes.

I am a complete novice at electronics, but wanted a tube tester to check my amp tubes. I don't even know how to use the machine yet, although it has the operating instructions manual with it at least.

Is this company still in business or making the same/similar model?

Thank you and please email me with your pricing or any info as to where I can get these tube charts, literature, parts, etc. related to this tester. It is appreciated.

Lance

Greetings....I have just recently been contacted by an elderly lady whos husband has become a Silent Key in the last year. She is trying to clean out his shack and asked for my help....In the shack is an FT102 with the FV102 Digital VFO, FC102 Antenna Tuner, FC102 Speaker, and FC102P Speaker with Patch. I am not sure of the condition of any of this equipment yet but will assume that it all still works...Question! What could she expect to get for the FT102 and accessories? I've looked in some of the magazines I have and can not even find mention of an FT102. Package deal or part out? Any comments would be greatly appreciated. 73....Roger

349. Ten-Tec 6M xverter & TS-430S help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-08 00:00:00 UTC
From: ken brookner <kenb@metronet.com>
Message-ID: <30F16C45.342EFEF0@metronet.com>
Source record: 207572

has anyone used the Ten-Tec 6 meter transverter kit with the Kenwood TS-430S transceiver? the Ten-Tec wants 20 meter input drive in the range of 0.25 watts up to 10 watts depending upon the value of R5.

the TS-430S can not control its RF output on SSB -- so it's about 100 watts all the time (unless i'm missing something here...). The 430's transverter ouput is listed as .7 volts @ 75 ohms -- which is too low.

ideas? am i missing something obvious?

thanks...

Rick,

I took out the rubber disk, but left the metal one in. No complaints so far.

I thought it necessary to leave in the metal disk because it looks like it is
needed to hold the mic element in place.

I don't think that Bill Cheek's contributions are the issue here, though I suspect from what I have seen that they are substantial. I have not been on this forum long enough to know any of the individuals involved in this flame war. If one was a clone of Adolf Hitler and the other Albert Schwitzer (sp?), I would not know it. It is tiring seeing all of the messages addressed to this feud. I don't have a problem using the delete key for messages that are not of interest to me, but I understand that some users of this newsgroup pay by the message. This must be particularly irritating to them.

That's it, no flames or no finger pointing, just a hope for a reduction in broadcast hostilities.

Was interested this radio but don't know much about it. If you have this
rig please e-mail back with any info.
Does it have the folling: 1) auto repeter offset
2) built in duplexer
3) remote operation from mic
4) remote operation from an HT
5) cross band duplex
Any reply on the ease of operation and audio would be great.
Thanks GOttria@AOL.Com

Just after he was rescued there was an article in one of the news magazines (US News?) or a segment on NPR which mentioned the model of radio. It was some version of the 112 which (amazingly enough) you can see on the Motorola Web Server at:

http://www.mot.com/GSTG/ged/rso/gps-112.html

363. Kenwood TH79A info needed

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-08 00:00:00 UTC
From: joe@sd.inri.com
Message-ID: <joe-0801960046520001@dialin4.sd.inri.com>
Source record: 207680

Purchased the TH79A about 3 months ago and I've finally gotten tired of people asking me to repeat myself. I'd swapped the radio with another ham on a recent hiking trip. He heard me fine transmiting with his ht and I kept asking him to repeat himself due to low audio, when he was transmiting with my ht.

My radio has been diagnosed with low deviation. I have access to the proper monitoring equipment and technicians but I don't have access to the maint. manual.

Any assistance re: the correct pot. to adjust would be greatly appreciated.
Thanks

I need to replace the 9.6v battery to the Kenwood TH79A/H. The prices range from $89.US in SanDiego to $49.US in NewYork.

Is one vendor any better than the other?

Are the aftermarket packs better/worse then the factory units?

Will the aftermarket units recharge correctly in the Kenwood QuikCharger?

Thanks,
73, Joe, KE6WEO

I, too, would like to hear from people. I'm looking at the 811, 811H or the AL-80B.

Thanks,
Kory
=======
Actually, I would like to hear from somebody who recently got a new Ameritron as far as HOW LONG it took them to get it. Perhaps, AES was cleaned out over the holidays but I called there over New Year's weekend to order an 811H and none were in stock then. I'm on the waiting list but they couldn't give me ANY time frame - "when more come in, we'll send you one" ... Very strange for an Ameritron... it's not like there Alpha's or something ... :<)

Peter, KE6VMJ

BTW, the guy at AES says that Ameritron is owned by MFJ now - can anybody confirm this?

Peter

MFJ and Ameritron have in fact merged. There 1996 catalog combines both product lines. According to HRO in Salem NH, it should be about six weeks for delivery. I am on the list for an AL-80B.

Message-ID: <4cs2ih$6t8@taxis.corp.titan.com>
Source record: 207684

Am looking to buy a 2M LNA for my AO-10/13 operations and am wondering how many LNA's out there can be bought with a built-in postselector. It would really be nice if someone makes one that is optimized for OSCAR operation. Low noise figure is important, but so is postselection filtering (usually a high-Q helical filter) and adjustable gain @ 10-30 dB. Thanks in advance for any info regarding what's available out there. Mark (AB6ZQ) mmonte@linkabit.titan.com

GE, OMs

This is an ancient receiver - the first of its kind - to
use a frequency synthesizer to derive 60 500Khz bands and
was one heck of a general coverage receiver. The front end
is still pretty hot.

Well, age has finally caught up with it, and the fqy syn.
has lost sync. I've gone in with a scope and managed to get
it limping again, but without an alignment procedure available
it is almost impossible to bring it up to par. Part of the
problem is not knowing what the spectrum oscillator's output should
look like.

Is there a doctor in the house? - someone who worked for Galaxy?

I hooked up the cable from my PacComm tnc to a RJ-48 connector and plugged it into the second mic connector on the back. It makes for a clean installation if you have the crimping tool for the RJ-48. I work for a telecommunications company so, of course, I did have the correct crimper. I haven't hooked up the multi connector that came with the radio yet as I am trying to come up with a means to duplicate their split connector configuration, as pictured in the manual on page 6. I think one could be made from the local Rat shack at an obvious savings...73

380. DX-70 has 2m ! ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-08 00:00:00 UTC
From: Paul Moller <Paul_Moller@csg.mot.com>
Message-ID: <30F132E0.C60@csg.mot.com>
Source record: 207697

Hello all,

I was using my magnifying lens the other day to read the schematic that came with a recently bought Alinco DX-70. I ran across a few interesting things. For instance, a receiver front end filter location identified as 144 RX. Also, in the vco area, there is a vco with a labeled output of 155-175 Mhz. This vco could be used as 84-104 RX by using the available 71Mhz IF. But, I could swear that I saw somewhere a 10.7 Mhz IF, which would then make for 144-164 RX using high side injection.

Since I have a hard time reading the small print of the schematic I am hoping that someone else will take a look and see if just maybe there is 2m RX in the DX-70 waiting to be unleashed.

Paul_Moller@csg.mot.com

From: ham@w3eax.umd.edu
Message-ID: <4cs2kk$ne6@cville-srv.wam.umd.edu>
Source record: 207701

I called them up (I have no vested interest other than I like the products) the other day about a few existing T-Kits.

They're coming out with a 2m - to - 6m transverter, to be sold in kit form, called the Model 1209. Like the 1208, it will be about $95, and will look very similar except that switching will have to be done externally.

A cheap way to get on 6m FM with your 2m rig!

I'm still pushing them about the 20m - 2m transverter for us QRPers with 20m QRP rigs, as matching units for the 6m transverters...

Rick it didn't generate any interest with me because I have my mike gain set to mid scale (5) and it generates plenty of ALC. My audio reports have been fine. It looks good in the scope and develops full output power.

Source record: 207506

I have an Atlas 350XL from the 1970's. The receiver still works, but unfortunately, it can no longer transmit. Does anyone know who might be able to repair this rig?

While this is by far not a state-of-the-art rig, it would be nice to get the old bird singing again, if it didn't cost too much.

Thanks,
Howard Moscovitz

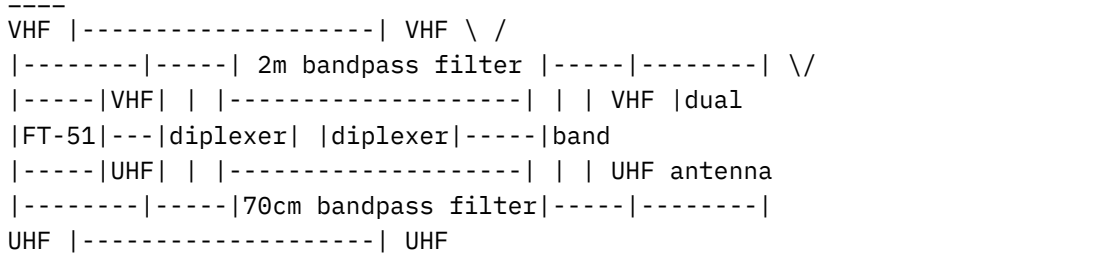
With the radio by itself, you're probably out of luck.

Every HT I've ever owned had at least some problem with intermod when connected to real antennas (instead of the rubber-duck). Mobile antennas seem OK in most instances, but home rooftop antennas are a problem. My FT-51 has that barn-door-wide front end so you can receive all the public service stuff, but you pay for it when it comes to intermod.

A good bandpass filter in front of the HT that only passes 144-148 and 440-450 will help, if not solve your problem. I've seen such filters from Tucker and others that cover either 2 meters or 70cm, but not both. If you use and have problems with both bands, you could either manually switch in the proper filter or use 2 diplexers to do the job....



If you have separate 2m and 70cm antenna, you can leave out the diplexer on the right side, and just connect directly to the two antenna.

I've used this arrangement to use separate 2m and 70cm amps with my HT, and then combine them into one dual band antenna, and it works great!

You can make 2 meter bandpass cavities from coffee cans that work pretty well, although you'll lose a dB or two through them. You can probably do better with good copper tubing or helical resonators.

Someone, I think it was Gary Coffman, posted the Icom 706 MARS Mod, it involved removing diode D59 if I recall correctly. I opened up my 706 lat night and could not find that diode for the life of me. Anyone done this mod, or anyone who can point out where D59 is located? A sketch would be nice, as there are many unlabeled, and expensive SMDs in the radio. I don't want to guess. Tnxs! 73 de Bruce KB2VKJ

On some radios you can set a Time Out Timer so that the driver can only
transmit for, say, 30 seconds before releasing the button. Other radios require
more extensive electronics modification.

Has anyone ever had their TM-742A suddenly fail on them, that is trying to turn it on and it does't come on at all. Pushing the power button repeatedly does no good. Dead. The interface cable between the display "head" is also ok.

All fuses and power lines are ok. No surges took place. This happened in the car with the engine turned OFF. Any suggestions as to what might have happened.

Would appreciate any help. Thanks in advance,

Alan WA6AQC

Hi Bob!

I've had an FT-100MP for several months. After I had used it for just a few weeks, I noticed that I wasn't using my FT-1000D anymore. The 'MP has better sounding audio on receive, if you can beleive that. I recently bought and installed every accessory filter available, so that brings the 'MP up to the filter compliment of the '1000D. I just sold the FT-1000D as well as an FT-990 that I had "plug-unplug" modified for using as an IF for VHF/UHF transverters. The 'MP has replaced both of them.

One thing I wish was different is the RF power control works fine on CW and normal SSB but defaults to full power with the voice processor turned on. Many folks have complained about overdriving their 8877 or 2x3CX800 amplifiers with the processor on. My amp has enough "dynamic headroom" so that I don't cause gross IMD if I overdrive it, but that would be naughty into an antenna, wouldn't it?

Simply put, I love my FT-1000MP.

Mike

Source record: 207529

Only a minor setback, Bob. If you can get it for a good price, grab it!

The IC-745, IC-271, R-71 and perhaps others, use a 3-volt lithium cell to retain the RAM memory. If you let the battery die, you lose the memory. The batteries last around 10 years. I know I am pushing my luck at 11 years with my IC-745. I bought the battery, but have been too lazy to open up the radio. It is a bit of a hassle as you have to maintain power to the memory board from an external source while you remove and replace the battery. I have already done it once on the IC-271 I used to have. Better get to it I suppose. In your case, of course, it is already too late.

Icom can reprogram the memory board for you, but it may be a tad pricey. There is a company called WILLCO Electronics at P.O. Box 788, New Lenox, IL, 60451 that will do it for $30. My info is a little dated so you would have to check with him (WA9FVP) to get the latest price. He also makes a replacement memory board for $125 that gives you 512 memory channels and uses a ROM to permanently store the microprocessor data.

I use my IC-745 in our motorhome. It is a fine little rig. It doesn't have all the bells and whistles of newer rigs, but it is probably one of the smallest available with a built-in (optional) A/C power supply. It also has 200 watts input. Most rigs today are around 150 watts. With the A/C supply, internal keyer and the proper filters it is a perfect, self-contained rig for portable use.

I bought one a few months ago for the same problem. In my case, S-9 line noise. My Timewave DSP wouldn't touch it as it desensitizes the receiver. The ANC-4 wipes the noise out so I can hear the atmospheric noise and weak signals underneath. The unit MUST be able to hear the same noise as your receiver to be able to cancel it out. You may have to fiddle with the small noise antenna to get it right. Mine works so well that I look forward to those cold, dry days that bring on the noise. I'm very happy with it.

418. HF Rig Selection for NEW ham IC-706,TS-50....?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-09 00:00:00 UTC
From: "BICC Info. Center" <W234@ohsu.edu>
Message-ID: <4csfo0$lp3@fremont.ohsu.edu>
Source record: 207581

I'm looking to upgrade from tech plus to general in the next few months and I have read the current news group info. I am wondering is the ICOM-706 the wonder radio of the decade or not. I've heard alot of good things about the kenwood TS-50 but it lacks 6m,2m coverage. If you were going to buy one radio for primarily HF work would you choose the 706 or do you think I'd be better off with a full sized HF rig like the Icom 728,738...ect.

I'd prefer an Email reply if possible at ashleyb@ohsu.edu

Thanks

Brad WB7TSO

422. SGC-230 Ground????

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-09 00:00:00 UTC
From: rickcrider@aol.com
Message-ID: <4ct3rb$iji@newsbf02.news.aol.com>
Source record: 207585

All:
OK.....OK.....First the admission of guilt: The antenna tuner is grounded to a cast iron natural gas pipe. Plain and simple. The tuner is mounted in the attic in a large two story house. It is the *only* existing contact with ground in the attic. (other than the ac third wire neutral) The only other possibility is running copper grounding wire across the attic , out of the boxing, winding it down around the various contours of the house to a driven ground rod. The ground wire would be about as long as the antenna itself.

Now, the problem: The rf signals are getting into the ac lines of the house. The unit tunes well, tx's and rx's well. Very well. (Fed from an ICOM 706 rig. The signals come through some domestic household receivers (AM/FM Cassette, tv, vcr, etc., *even* when they are turned *off*.)

I need help. Thanks.
Rick Crider

426. How to set Deviation on HTX202?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-09 00:00:00 UTC
From: lazeraud@sentex.net
Message-ID: <4cu4ig$doe@granite.sentex.net>
Source record: 207589

Greetings. I have a local repeater that is very sensitive to DTMF tone for the auto patch. The radio has an output deviation of 3.2 Khz using the DTMF pad, and I have been told that the repeater won't decode tones of over 2.9. Is there a separate adjustment for just the DTMF output. I found that by adjusting vr1 (mic audio deviation) doesn't change the tones output at all.

Thanks for any help,

Tedd

>Has anyone tried any of the DSP audio filters?

How about the Hamblaster??

The "HAMBLASTER" DSP Card

The HAMBLASTER DSP plugs into a PC compatable expansion port
and provides multimedia capabilities for HAM radio applications. It's
not compatable with the Soundblaster (1) or Soundblaster compatable

multimedia cards. It's a stand-alone Digital Signal Processor that can
runs on it's own software even while other sounds cards are installed.

DSP programs are uploaded from the PC to the HAMBLASTER providing
unlimited filters, that are easly upgraded from a disk and downloaded from
a
Computer Bullitine Board. It has an audio I/O port that provides a simple
interface
to a Ham Radio transceiver and a digital port for interfacing a TNC.
Other applications
can include a relay control for speech recognition, Dual port TNC or tone
detection. The flexibility of the system will permit new applications and

incourage third party software development that will be available
exclusively
for Ham Radio.

The programs that are included in this package where developed for Ham
Radio
applications by HAM radio operators like yourself and provide a friendly
user
interface that run under DOS. (Windows applications will be available
soon).

Simply wire the HAMBLASTER audio input to your radio and the audio
output to an amplified speaker and then load any of the application
programs provided.

DSP application software provided:

1) LMS Voice Filter: Provides a selectable bandpass filter program
followed by an LMS autonotch program to eliminate irritating hetrodynes
that are a common occurance on amatuer radio bands. You can also invoke a
propietary LMS noise reduction program that significantly reduces buzz,
impulse noise, random noise while enhancing correlated signal sources

such as voice. It should be stressed that the noise reduction algorithms will not "pick voice" out of the noise and improve the intelligibility, but it does significantly reduce the tiring noise that is often present on the Ham bands. Variations in the voice filter algorithms are provided so that the user can select the best algorithm to suit the situation.

2) Moon Filter: Tuneable linear phase bandpass filter for data & code.
Filter bamdwidths: From 1 Hz to 1024 Hz
Tuning range: 100 Hz to 3000 Hz in 0.1 Hz steps
Autotuning: Centers filter over signal in the passband of the filter.
Xchange: Stores and exchanges current center frequency with previous.
Noise reduction: Nonlinear compression reduces noise and ringing.
Morse Decoder: Adaptable Decoder displays the received text.

3) Code filter: An easily configured conventional linear phase filter with a spectrum display.
Filter type: 120 tap linear phase FIR
Filter bandwidths: 50, 100, 200, 400 and 800 Hz.
Center frequencies: 400 to 2200 Hz in 200 Hz steps
Sample frequency: 2 kHz to 10 kHz
Spectral Display: 100 Hz to 3 kHz

4) A DTMF logger automatically decodes DTMF tones from an audio source and prints the numbers to the PC screen and a diskfile with the corresponding time and date.

5) Hear: A 4 second digital recorder handy for repeating call signs or recording, editing and displaying sound files.

Options: 1) Internal 12 volt switching supply: Allows the PC to be powered down
leaving the Hamblaster to be powered by an external 12 volt source .

2) DSP Programmers kit: Some source code and programming examples along with hardware information are provided for those who have the knowlege
to get involved in the exciting field of DSP. It should be noted that this is reserved
for the dedicated DSP Engineer and is intended to provide 3rd party software development exclusively for the Hamblaster

SPECIFICATION SUMMARY:

HARDWARE PROVIDED:
1) Hamblaster DSP card (inserts in an 8 bit slot in PC):
a) 50mhz TMS320C25 DSP
b) 64k bytes Data ram
c) 64k bytes prog memory
d) Analog Interface: TI TLC320AC01
Sample and hold Analog to Digital Converter
sample rate up to 40kHz
14 bit ADC and DAC
programmable input gain

programmable output gain
anti-aliasing filters
e) 8 bit I/O for controlling external devices
f) Optional remote powering interface
2) DB9 and DB25 mating connectors
3) 3.5" Disk

SOFTWARE PROVIDED:
1) LMS Voice FIlter:
Windows, DOS control program; DSP binary file
15 Bandpass voice filters (60 tap linear phase FIR)
LMS Autonotch filter with Freeze
LMS Noise reduction filter with Freeze

2) Moon Filter:
DOS control program; DSP binary file
Unique tuneable linear phase filter capable of very narrow
bandwidths.

3) Data and Code filter:
DOS control program; DSP binary file
15 Bandpass linear phase code filters (120 taps)

4) DTMF autologging software:
DOS control program; DSP binary file

5) Hear: A digital recorder for 4 second soundfiles

Owners Manual (with memory maps and schematic).
Program Manual: Provides detailed description of programs provided.

OPTIONAL EXTRAS:
1) External remote power supply
2) DSP programmer kit:
a) Source code for Data and Code filter program:
PC control program written in Power Basic
TMS assembly language DSP source code
b) TI TMS320C25 Assembler
c) Download program

Foot Notes

1: The Soundblaster is a product of Creative Labs Inc.

From jococour@cdsnet.net Tue Jan 9 01:16:23 1996
To: charles1@netcom.com
Newsgroups: rec.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.misc
Subject: Re: Vote here in Favor of Bill Cheek
From: jococour@cdsnet.net (Mr. Ed)

I have never read any of Mr. Cheek's books, nor have I applied any mods
to my scanner, however, I believe that without him discovering and
disseminating his mods, the scanner world would be an infinitely lesser
community. The speed mods, memory mods, restoration mods, etc., all of
these mods were first discovered by Mr. Cheek, and his attitude of "let's
see what I can make this scanner REALLY do!" has changed the attitudes of
the community to where the consumer expects a good deal more control over
his scanner. Also, his no-bs evaluations have helped me out tremendously.
So often in radio publications, the authors are forced to be somewhat
sycophantic in regards to reviewing their advertiser's scanners...hence,
reviews sometimes seem to be a little sugar-coated. Well, with Bill, you
get his straight unvarnished opinions. True, they're sometimes harsh,
sometimes profane, but so was give-'em-hell-Harry! In short, I vote a
solid YES to Bill Cheek's value to this NG, and to the scanning community
at large

Howdy!

I have, new in the box, one WAYCOM 220MHz Repeater Duplexer. It stands about 2 1/2' tall and is about 2' wide. It has Four large cavities, built for Amature 220 Bands, but shoud tune slightly higher or lower, within limits. I suspect that it should handle 200 watts with no problems. Original cost: hundreds of dollars.

It has never been in service as my repeater pair went to UPS, when they bought the frequencies from the FCC ~ just as the Duplexer was shipped. It has been in a corner of my shop since.

I want in trade, a High Quality scanner WITH RS232 interface. Please email me with your offer and I'll research your scanner for it's specifications/value. Please note that I have four other scanners of quality, less the RS232 interface. Please don't offer me another one.

Thanks!

Please contact via email:

Hi: A friend of mine bought an FT470 last summer, paying $350. It was in pristine condition, and had been mod'ed to function out of band. The radio came with 2 large capacity batteries and 2 smaller batteris, a speaker mic, a fast charger and a slow charger. Also got 4 empty battery cases that could have new batteries installed. On the whole, this friend reports the purchase to been a good deal and is satisfied with the radio.

Hope that helps,
Chris, N7RME

The relevant Federal Aviation Regulation states:

Sec. 77.13 Construction or alteration requiring notice.

(a) Except as provided in Sec. 77.15, each sponsor who proposes any of the following construction or alteration shall notify the Administrator in the form and manner prescribed in Sec. 77.17:
(1) Any construction or alteration of more than 200 feet in height above the ground level at its site.
(2) Any construction or alteration of greater height than an imaginary surface extending outward and upward at one of the following slopes:
(i) 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport specified in paragraph (a)(5) of this section with at least one runway more than 3,200 feet in actual length, excluding heliports.
(ii) 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport specified in paragraph (a)(5) of this section with its longest runway no more than 3,200 feet in actual length, excluding heliports.
(iii) 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport specified in paragraph (a)(5) of this section.

Sec. 77.15 Construction or alteration not requiring notice.

No person is required to notify the Administrator for any of the following construction or alteration:
(a) Any object that would be shielded by existing structures of a permanent and substantial character or by natural terrain or topographic features of equal or greater height, and would be located in the congested area of a city, town, or settlement where it is evident beyond all reasonable doubt that the structure so shielded will not adversely affect safety in air navigation.
(b) Any antenna structure of 20 feet or less in height except one that would increase the height of another antenna structure.

WANTED: Analog Synths, Drum Machines, FX, Etc...

Arp, Akai, Boss, Buchla, Crumar, Chroma, Electric Dream Plant,
Electro-Harmonix, EML, EMS, Korg, Moog, Oberhiem, Octave/Plateau,
PAIA, PPG, Roland, Serge, Sequential Circuts, Simmons, Yamaha, etc

* Older stuff - With or Without MIDI
* Synthesizers - analog, modular, patchable, some digital, etc
* Drum machines, Ryhthm units - analog
* Sequencers - CV & Gate
* Converter units - MIDI to CV gate, etc
* Sync units - Din Sync, etc.
* Effects processors - tube, analog, digital
* Vocoders
* Effects pedals
* Even Newer Stuff (depending what it is)
* Also Wanted: Tube Recording Gear, Tube Mics, Tube Mic Pre-amps, etc...

* Anything else that falls under the electronic music realm...

Please write back with info... Thanks in advance

I heard langietr@dsd.northrop.com say:

: Can anyone provide information on how I can obtain any Hallicrafter's radio
: or communications equipment.

Among the best places to start looking are local hamfests. Since older rigs can cost a small fortune to ship, due to their size and weight, you can save considerable cash by humping the treasure away yourself (save your back: lift from the knees!) You also get to touch and feel the rig, and talk with the seller, who not infrequently has a tale to tell. Also, since many folks are more interested in renovating than actually keeping some of these old sets, it's possible to find some beautifully restored equipment which works as well as it did when it was new. It's also possible to find some truly mint gear as well, like my own Halli SX-115, but expect to pay a little extra for the privilege of owning such a specimen.

Moore's book is the best commonly available reference for Hallicrafters and similar vintage equipment, as somebody already pointed out. The Osterman book includes coverage of many solid-state sets, as does the 2-volume 'Chance or Choice' set from Gilfer.

There is also a mailing list for people interested in vintage tube radio technology, including Hallicrafters (and an ftp site for the archives and other material), several magazines, a weekly on-air swap net on 75 meters just for vintage gear....and lots of folks with similar interests. Drop me a line if you have questions about any of these resources, and I'll try to help.

446. Good dual-band mobiles to use for remote repeater inputs?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-10 00:00:00 UTC
From: pruth@ocvaxa.cc.oberlin.edu
Message-ID: <4d1ci6$83k@news.cc.oberlin.edu>
Source record: 207459

Our club is trying to get remote inputs up and running, and
we are considering using a pair of dual band mobiles for at
least one of the links, 2m/440Mhz, for crossbanding. What are
good, reliable rigs to use for this application? One of our
technical committee people felt that whatever we chose (he mentioned
"Kenwood 741 (sic)" we would have to add outboard heatsinks even
if we ran them at no more than 5 watts. Thanks for your advice.

447. Dual Band ic-245

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-10 00:00:00 UTC
From: n0nas@hamlink.mn.org
Message-ID: <821264214.AA04929@hamlink.mn.org>
Source record: 207460

CA>From: carlosr@csulb.edu (Carlos Ramirez)
CA>I would like to get information on this old Icom radio. I know that it is an
CA>all mode transceiver. Somebody wants to sale it to me for $200. I would
CA>like to know if it has tones to hit the repeaters and if the price is
CA>reasonable. All your help would be appreciated.

The Icom IC-245 is a 144-148 MHz FM/SSB/CW transceiver that runs about
8 to 10 watts output. It is an old radio, probably mid 1980's. It does
NOT have built in tone capability. In fact it doesn't have any
significant memory channel capability either. It says it has one memory
but mine doesn't work. It takes almost forever to tune from one
end of the band to the other because the tuning rate is very slow.

I have one of these radios but the display died, I think a voltage
regulator quit. I think the $200 price is fairly reasonable for a SSB
radio. But don't buy it if what you want is an FM radio because the
tuning will drive you nuts. I do consider it to be a usable radio for
SSB although it isn't any where near the top. It has a lot of warts but
is a cheap way to get started on 2M SSB.

Don't forget the difference in antennas. For FM you want vertical
polarization, for SSB you want horizontal. You can make opposite
polarization contacts but it isn't good for any distance. Either you
want two antennas or consider a cross polarized antenna designed for
satellite work.

The January VHF/UHF contest is coming very soon. Even if you don't buy
the SSB radio, tune around the FM simplex frequencies (but NOT 146.52)
and join the fun. The only thing you need to know is your grid square
and your first contact can probably tell you if you don't know already.

73's.

Hi all..
Does anyone know of a Kenwood auto tuner problem?
I know of a rig that will draw lots of current when you get to 20 thru 10 m and the AT will not tune for about 5 or 10 min. Then, it is fine.
On 40 and 80m there is no problem.
Has anyone ever heard of this problem or know what it may be?
I am think the tuner but I dunno.
Also, any good, fast Kenwood service areas near Cleveland or Pittsburgh?
thx and 73s

Direct e-mail sent to originator ... this posted for the benefit of the group as a whole ...

Actually, the entire radio does not need to be sent to Icom ... only the small "daughter board" that has the (volatile) E-PROM on it, along with its associated lithium backup cell (about the size of a quarter).

You can check to see if the lithium cell is gone (and along with it, the contents of the E-PROM) by measuring the voltage of the battery with an accurate digital VOM ... the battery terminal voltage should be at or very near 3.00 volts DC. If it is significantly below that, remove the board and send it to the nearest Icom Service Center (see last page of AES catalog for nearest location - another good AES service!).

Unfortunately, this procedure is one that Icom never released to the Dealer Service Network ... it must be done at Icom ... but their charge is nominal, and turnaround is good.

Good luck and very 73,

>
>

Hi Scott,

Mine works fine. If I was to be critical about anything at all, it would be the tendency to overload on strong out of band signals on HF. It sure isn't as immune to overload as my R4C or ICOM 751A. Turning off the preamp or adding attenuation removes those HF problems and still allows reception of weak DX signals.

To date I have had no problems with six or two meters, and it looks good on the spectrum analyzer. So far I think it's a very nice mobile or casual HF rig, and certainly worth the money.

Thanks for the info, Mike...

I put an Astatic RD-104E on my 706 today. Everyone said it was a huge
improvement over the Icom mike. All I have to do is figure out how to
get the UP/DOWN buttons working. (I put the buttons in the mic for the
IC-706s' predecessor.)

the company has been out of business several decades. most of us over 40 grew up with hallicrafter shortwave radios (unless you were a hammarlund or national radio devotee), so when we get nostalgic, we start looking for them on the used market.
Universal Radio has several books showing the Hallicrafter line of products (one is by Fred Osterman, the other by Raymond Moore), as well as SW radios by others.
they're at 800 431 3939

All Kenwood parts (at least on the west coast) are now being handled by
Pacific Coast Parts Distributors, 15024 Staff Court, Gardena, CA 90247.
Their numbers are: (800) 262-1312, (310) 515-0207, FAX: (310) 538-4919.
They also handle a number of other lines such as Alpine, Toshiba,
Panasonic, Technics, Quasar, and others. Hope this helps.

477. Yaesu FT-8500 Autodial Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-10 00:00:00 UTC
From: username@shore.net
Message-ID: <4d0avc$slq@shore.shore.net>
Source record: 207532

I posted a question a week or so ago with no luck, so I'll try again.

I programmed some autodial tones and text in my FT 8500, and can do a speed dial by holding down the appropriate digit while pushing the PTT. What I can't do is display the text that corresponds to the speed dial memory. The manual is very vague on this feature, but I figure it must be do-able, because the text is entered in the memory. I use the ADMS software, by the way.

Any ideas? Any other tricks to this very capable but complicated radio?

Thanks and 73 de Mike, N1PQG

>these mods were first discovered by Mr. Cheek...
>Mr Ed
>jococour@cdsnet.net

Not hardly! With all due respect to the Mr. Cheek and the scanning community much of his information is based on Mr. Parnass's work at Bell Labs. You'll see things in Bill Cheeks books that look real familiar to Bill Parness's work with due credit to him...this leads me to believe that Mr. Cheek is purely in this for his own interests...it's easy to copy and compile. Much of the information in his compilations can be easily found on the internet and are authored by individual certainly not credited in Bill's books.

Obviously he like to prolong the controvery here on the groups becasue it more publicity for him. Here's a though to ponder...do you think it's actually him logging on as an alias?

Let's get back to group theme and forget this fool.

RE:----------

ICOM-229H value:

Amateur Radio Electronics offered the last sale price for a 229H of $329.
Note that this radio is not "current equipment", nor available new.

Included in the box was:

ICOM-229H, original equipment and functionality: (OE = Original Equipment)
Original, dated purchase receipt (establishes ownership and date).
Original box, with serial number on the outside.
Instruction/Owner's Manual.
High-Power 12V red/black cable w/power connector.
Mounting bracket and screws/washers.
FEATURES:
DTMF keyboard on microphone, with autodialer.
CTCSS subaudible tone encoder.
20 memories.
programmable call channel and offsets.
battery saver mode.

Generally, electronics depreciate approximately 1/4 to 1/2 of their
"last new price", after 1 year.

->I<- value a 229H with serial number > 50,000, with an original
purchase receipt < 1 year old as worth 80% of "last sale price".

AGE SERIAL $ COMMENT
- < 1yr and > 50,000, 80% 229H $263. "$250 ballpark".
- < 2yr and > 40,000, 70% 229H $230. "$220 ballpark".

Who the Fuck cares about the Publications!!!

Man are your idiots missing a few screws.

What Is Bill a God or something? Give me
a fucking brake.

So he has a book out. wippieeeeee Big deal. Its not hard to
do the same kiddies! Becides does that make someone right?

Two seperate issues here guys WAKE UP!

rec.radio.scanner
and
some book

(mods that if you can figure out yourself how to do with
a service manuel then it offers some help)

Whats this Vote CRAP?? More fuel??

As for the Three people taking issue with Bill, better think
again. Not everyone is as stupied as the rest of you and has to
always add his two cents worth. Somethimes it better to say
nothing then to say anything.

As for Andy and Bill They are both trouble makers.

They are acting like children. He said she said. Both want the
last word. Personally I beleave Andy has started the whole thing He
sure has with me in the past. So I'm talking with experience. But It

takes a bigger person to end it. Andy has. Bill continues. So who's better?? None they both are looking for attention and know how to get it.

You kids are just adding fuel to their little flame.

Bills Book if you find it useful is a seperate issue from this newsgroup. Remember that. You talk about how one contributes to this newsgroup then look at the content of their messages not what they are selling.

Wake up Kids Think about what you say before you say it!

g_reed@icon.net (Glenn Reed) wrote:

> It is tiring seeing all of the messages addressed to this feud.

I take it you think that feeling is legit. Ok. I can handle that.
Now can you (anyone) handle some of the things I am tired of?
There's the rub. One person (not especially you) tires of something
and expects the right to quell it with a command or a plea. Others,
like me so far, simply don't express what we're tired of. When the
tables are turned, however, it's suddenly a different story.

> I don't have a problem using the delete key for messages that are not of
>interest to me,

Right on! Me, too. Or not download those messages in the first
place. Which resolves the hypothetical problem you raise next.

>but I understand that some users of this newsgroup pay by the
>message. This must be particularly irritating to them.

Whooaaa......(1) they are getting ripped off, if that is the case.
What are the bona-fide situations where newsgroups are available only
by the message meter? WHO would tolerate such a thing? Do they not
have alternatives? And if not, then (2) Some newsgroup reader/editors
allow picking and choosing off-line those messages to be downloaded.
The problem you raise here is not one that should merit condescending
by the rest of the crowd. Horses are not allowed on the freeways, and
in many states, neither are bicycles, pedestrians, and underpowered
vehicles (motorscooters).

> That's it, no flames or no finger pointing, just a hope for a reduction in
> broadcast hostilities.

That's cool. But the cessation MUST begin by those who initiate it,
no? I mean.......HOW can the recipients of this bullshit reduce it?
Could the 6-million victims of Hitler's holocaust have reduced the
number of deaths by.......being more placid and peaceful? Ri---ght.

The best possible solution, methinks IMHO, is for those who START it
to STOP it. Well, it is verrrrrry interesting how three of the
biggest perpetrators and continuers of this bullshit are Peter (PjB)
Breath, Michael Alexander, and Andy Moss, though Moss appears to have
ceased and desisted now....and he WAS the ONLY aggressor at one time,
not two weeks ago. HE stirred the shit; he fanned the flames; he kept
it smoldering and buring for a year. And now he's made a graceful
exit leaving Peter (PjB) Breath and Michael Alexander to continue his

dirty work.

Far better you express your hope THESE TWO stop and then see what happens if, and when they do. I have taken steps to start doing my part, but so long as they keep it up, you can't expect me or anyone else to "let it go". No. They will stop. And my resolve on this is carved in basalt and granite.....vote or no vote.....one against a million or a million against one. The record and the facts speak for themselves. Neither Breath nor Alexander had ANY call or provocation to jump in, much less continue these hostilities.

Please address your comments and hopes to THEM where the bullseye stands out like a sore thumb. Shooting from the hip into the dark cannot hit home. "Home" is where I told you, but don't take my word for it. Check the record. Ask around.

Thanks.

Bill Cheek

> what have I said or done that you find objectionable? Cite an
> instance or two,

The objection is how YOU took a flying leap of faith, unprovoked and unneeded, and landed into a whole world of shit. And then had the medicine balls to cry foul and pretend innocence. You had no call to zero in on me when I showed up for Andy Moss. I went for HIM; not you. I didn't know YOU from Waltzing Mathilda at the time.

And then to make matters worse, you're STILL involved in something that never pertained to you; never involved you; and never provoked you. You've done painted yourself into a corner....and instead of seeing where you went wrong, you're STILL lashing out.

Mr. Alexander, you were and remain categorically OUT OF ORDER.
That, sir, is the objection. Like it or lump it, that's the record.

Excuse me? Beg your pardon? You get down and state EXACTLY what you
think is Mr. Parnass' work. Better still, you get HIM to confront me
here, if HE thinks I plagiarized his work. You understand me? I'm
getting "virtually" pissed at this crap, first initiated by Moss and
then you. I don't plagiarize, period. I had never heard of Mr.
Parnass during the course of my first two books, and there is nothing
in the 3rd to even resemble his work. But not in the first two,
either. Why don't you let Mr. Parnass vocalize this shit if he thinks
it. You certainly are in no position to speak for HIM or me. And if
Mr. Parnass published anything at all that resembles what's in my
books, it is possible that he got the ideas or the procedures from ME.

You never looked at it that way, now did you?

> You'll see things in Bill Cheeks books that look real familiar to Bill Parness's work

Like what? What "things"? Put up or shut up. Don't pop off your
mouth unless you can back it up. Spit it out. Task me with your
specific accusations right here. I will address each one. Otherwise,
the diarrhea of your mouth is dribbling down your shirt from that hole
in your lip.

>with due credit to him...this leads me to believe that Mr. Cheek is purely in
>this for his own interests...it's easy to copy and compile. Much of the
>information in his compilations can be easily found on the internet and are
>authored by individual certainly not credited in Bill's books.

If these mods are on the Internet, then they were plagiarized from my
books. I know the source and history of every item in my books, and
either credit was rendered to the source, or I did the development and
research! Without exception. If you bothered to READ, you'd see this
to be the case. So put up or shup up. dingleberry!

>Obviously he like to prolong the controvery here on the groups becasue it more
>publicity for him. Here's a though to ponder...do you think it's actually him
>logging on as an alias? Let's get back to group theme and forget this fool.

Go ahead. That's your business. But when you dabble in libelous
statements, you and me are going to do a little rockin' of the boat,
and I hope you can swim.

Now let's set the record straight about Mr. Parnass. There was ONE instance where I may have published something of his. It was in a column for Monitoring Times a couple or three years back...where a reader sent me a "procedure" for VLF tuning an ICOM R-71. I published it in my column. A few months later, Parnass told Monitoring Times the procedure was his. As far as I am concerned, it's hearsay and unsubstantiated, but we apologized and that was that.

Since then, I have been reluctant to accept ANY outside input for further publication, because I have neither the time nor the resources to track down every little tidbit of information that comes my way.

However, you or Mr. Parnass should get down and dirty with what you've just shit out of your mouth above, because this is one area I am NOT going to take sitting down. Moss started it; you're keeping it going; so ask me specific questions and let's get this resolved. NOW.

I tried that mod, and I can't get it to work as described. Now, I many have a difficult time understanding some of the instructions that were given, but it looks right from all of the information that appear on the above page.

I can present a before and after schematic of what I did, and then someone could tell me where I went wrong. I really want to get this going.

Just ordered two used Bendix/King 210 channel hand units (EPH's??) to add to the 40-some the City already owns. In an understandable move of self-preservation, the local shop still won't sell me a programming cable.

Since we're a disaster communications team, chances are great (read that "100%") that we'll have to do extensive reprogramming in the field on a mission-specific basis. Anybody know where I can get the required programming cable? Will King sell me one? We have the software, but only one cable, and it doesn't actually belong to the team. I know the radios are "sort of" field programmable manually, but we usually don't have that much time to spare. I'm spoiled with the TK630/730/830 rigs and their great software.

Just tried the test version of KAGOLD. When I exited and tried using
my packterm again it does not accept commands!!! I had this problem with
another program and had to HARD reset the tnc. Packterm may be a very
basic program but it doesn't give me fits like the other ones I try. I
actually like it. I fear I now have to hard reset the tnc (Again) and it's
a pain to have to reset all my settings. Is there away around this? Why
does these other program screw around with the tnc settings to begin with?

Help via e-mail appreciated!!

tsmith@ici.net (Tim Smith) writes:

BC>Bottom line is that you have an axe to grind and we're going to
BC>get to the bottom of it. I can't imagine what, but your lack of
BC>candor and vicious attack is more than provocative.

TS> But doesn't your reation to my lack of candor tell the populas
somethhing?

It should scream I am not afraid to deal
with your allegations up front, in public.
When a person has something to hide, he really
doesn't want it laundered in public, now does he?

Kind of like how you don't want to discuss
this on the public forum anymore. You're a
sleazeball liar and it is probable that I
can prove it with facts if we deal in public
where you spewed the venomous lies.

TS> Most personalities would simply ignore an alegation
TS> if there were no truth...

Would they now? Have you ever wondered why there are
so few or no "personalities" live and up front on the
radio newsgroups? Do people lie about them, too?
No wonder they're not present.

And it depends on the allegation. If you spouted
that I knew nothing about scanners, that would be
laughable and ignorable. To accuse me of plagiarizing
in general, is in-between. Maybe good for a chuckle
and a retort. To accuse me of plagiarizing Bob Parnass'
work is utterly despicable; not funny; and not ignorable.

Furthermore, your lying casts a pall over Mr. Parnass, too.
You see, questions immediately arise out of your mindless
thoughtlessness:

"Does your allegation that I plagiarized Mr. Parnass'
work come from YOU, or does it come from HIM?" "Did you
hear something from HIM on this note?" "Is HE saying
I plagiarized his work?" If HE said it, then I need
to deal with HIM.

Plagiarizing is WRONG. If a wrong has been done, then
it needs to be made right somehow. I don't know what
needs to be made right until it is established that
you're lying or telling the truth. You can't possibly
be telling the TRUTH unless you heard it from Mr. Parnass.

If so, I need to deal with *him*; not you.

Yet, in my good conscience and knowledge, I have not
plagiarized any works of others, and it is a gut-shot
that you blew Moss's trumpet. This matter now needs a
resolution.

When a lying sonofabitch steps over that fine line
between harmless and harmful, all bets are off. Your
spew is designed to cause me harm and loss. I am not
playing to the crowd, Smith. I am taking to YOU. But
you spewed your venom in public; we will resolve it there.

I am just a dude, Smith. I have a life, a livelihood,
and a family, all of which are within the target of your
vile, nasty lies. You went for my juglar; the kill.

Pardon me if I counter....not with lies, but with truth.
And I will deal with it until the matter is resolved.

In public.

Yaesu does offer a second sindgle sheet which shows cross-band repeat operation.

Here is what you do for Cross-band Repeat Mode:

- Turn OFF the radio
- Press and hold the RPT button while turning on the Radio
- Your now in the X-Band mod.
- Repeat again to turn OFF the Cross-band repeat mode.

Good Luck and 73's

This isn't exactly a list, but I usually use old QST magazines. There is
always some guy at a hamfest or in the club that will either give you old
magazines, or sell them for 10 cents a piece. When I find a stock, I grab
one from about every 6 months or so. You're almost guaranteed to see the
original ad in one of them.

Source record: 207366

Gas pipes don't always make a good ground. Mains and services are often plastic.

Electrical currents on gas pipes can create havoc with cathodic protection causing thin spots or holes in mains and services.

Gas traveling through the earth through one of these holes can lose its odorant, accumulate in a basement, and be ignited without warning.

Suggest you find a different ground... Perhaps guttering.

The pictures I have seen of the SGC tuner show it mounted on a metal vehicle body. Perhaps some random cheets of heavy aluminum foil would create a better ground plane.

Good luck,
de N0USP, Dick (I spent 13yrs. with a gas co.)

The FT-102 was marketed in the early-to-mid 1980s, and was never very popular in the US; it did much better in Europe and Asia. It's a pretty good radio, although by today's standards fairly feature-poor. It has an odd final amp configuration: three 6146Bs in parallel. There's also a driver tube; the rest of the radio is solid state. There are many, many DIP relays in this rig, and they have a tendency to go resistive; relay replacement is a fairly standard fix, and is not particularly cheap. There is a guy who advertises in QST who specializes in this. The digital VFO is very nice, but has only 6 memories. The tuner works fine, and will handle 1.5 KW, but is a straightforward manual tuner, not automatic. The whole package together should fetch something like $700 - $800 depending on cosmetic condition, assuming it all works with no problems. There are a few FT-102 weenies out there (I used to be one :-) who might be interested in parts (especially the tuner; they're not all that common), so it's possible that you might get a bit more if you sell them separately. Best of luck.

Source record: 207370

Looking for a bargain basement/swap meet priced Hickok 750
series or Hickok 752 series dynamic mutual conductance tube
tester.

I was looking for some of the TV-7 models, but discovered these
higher end Hickok units do not go for that much more in good
condition as reported by some net folks who have purchased them
at such events locally.

If interested email me with a your Hickok's model # and a price.

Thank you.

P.S. Hickok is still in business, but no longer has any information
on their older test gear. (Only the present line of automotive test
gear.)However, since Hickock machines were fairly popular,
I'm sure a reprint of the manuals could be obtained.

I believe Charles Copeland did the first cross post to the non scanner radio groups. As I e-mailed to Mr Copeland this flame war is of little interest to the non-scanner crowd.

Bill Cheek you are doing yourself much more harm than good reputation wise by posting before regaining your temper. I have read your books and columns and in the past had some respect for you and your efforts. I too, have a temper, but your postings particularly with the challenges and foul language do little to shore up your public image. If the intent of your adversaries is to make you look bad you are helping them tenfold with your "defense". I know my respect for you has been diminished and I am sure the respect of others has also.

>Anyone use the Renewal system? I was thinking about getting into it.

Yes. The cells are really designed for low-current, long-duration applications. If you try to get more than about 0.1C out of a cell, it's amp-hour capacity drops really quickly. Bad news for ham usage which involves transmitting. Works fine for low-current receiver & accessory applications. Ray-O-Vac publishes some pretty detailed product information brochures & spec sheets for OEM usages and you can get it from them. In a nutshell I wouldn't use the cells in anything with an uneven or high current drain requirements.

>
>Does anyone out there know what the AUX postion on the band selector
>means? There is no reference to this in the owners manual.

I have a TS-820. I am guessing the AUX refers to use of fixed internal
crystals to select frequency. There are 4 on the TS-820, but it
doesn't say AUX, but FIX.

>Also does anyone know where I can get ahold on a DG-5 digital display for
>that transceiver. I am VERY interested in attaining one.

Those are rare as hens teeth. There is an after market outfit
that sells them for $200 brand new. You could almost buy another
TS-520 for that.

I have a Sony 2010 general coverage receiver I use. Set it up
to receive with antenna down and RF antennuator all way down.
Crank up rig and adjust till voice matches what you hear on 2010.
Then you are exactly on frequency, or very close.

521. Yaesu 757GX repair tips?

Source record: 207376

Hi all, I have a flakey 757 that I'm about to repair for the third time, and was wondering if anyone has experience with repairing this model.

Previous repairs were to replace the keyer cpu that fried after transmitting into a very non resonant antenna. The rig has always seemed sensitive to having tx rf in the shack, and I added a few bypass capacitors to the keyer inputs to try to avoid more problems. Now it's having a problem where the display goes blank. I suspect a bad solder joint, but while I'm in there, I thought I'd check to see if anyone has any recommended mods, or tips on other things to check.

Thanks,

Steve VE6STV

It has probably placed your TNC in "Host" mode; you probably like to
have it in Converse mode.

If you recall what speed you were using for the Gold demo, match
that speed with your terminal program (if it differs) and attempt to
send three plus signs. Some TNC return to converse mode with that
sequence.

Alternatively, set your Other tnc program to Host mode and off you
go!

The diagram I'm looking at shows it to be on the top of the radio, slightly to the left of center. It appears to be one of those diodes in a carrier widgets. The p[icture shows it to be the second from the left if the front is toward you and you look down on it. It shows space for five of the diode widgets, with spaces 1,2, and 5 occupied. Number 2 is D59.

I haven't done it, nor do I have the radio. I am just telling what I found in a book.

Eddie,

Never thought that it might be that simple, but it certainly worth a
look. I have noticed that when the car headlights, and air condx. are on
all together, that (especially on 6M at 50W, more than 440) it will XMIT
and then suddenly shut down. If you hold the PTT down, it will try to
XMIT again and repeat the cycle over and over, suggesting that it could

be a cold solder joint. Will have to investigate. Kewood suggested that it probably was 1 or 2 blown IC's from a surge. Don't know what to think, but will have to look and see.

Thanks again for the suggestion, was looking for something much less gross.

Alan, WA6AQC

BC>>convinced them, too. Yup, that's what "ignoring the bastards"
gets.

TS> I have no association with the above gentlemen. My observations
are independant.
TS> I see you've pissed off someone at Prentice...nice job..did you go
to school for that
TS> specialized form of marketing?

I am not in the newsgroup for marketing. Radio is my hobby, too.

If someone at Prentice Hall is pissed, so what? I have other friends
there, some well placed. <shrug>

If your observations are "independent", then why will you not confront
me with them in public in the offhand chance you failed to observe
very
clearly; i.e., you made a mistake?

You levied an accusation against me of profound magnitude. Why will
you not give me an opportunity to deal with it; to answer to it?
Obviously, your intentions are rather foul.

You're saying Hobby Radio and notably scanning would be better off
if you "killed me" or ran me off?

:-))) Just today, a fellow ham called my old rig a boat anchor. The Heathkit HW101. This is real amateur radio, when blessed with the opportunity to own and operate one of these sets. I would rather own a boat anchor than one of the new transitorized radios today. Real amateur radio involves doing for yourself, such as building your own antenna beam or stringing a long wire from one tree to another...it's a hands on hobby with real rewards. I love ham radio and I love the old boat anchors. Just my 2 cents worth.

Source record: 207392

I tried a dsp on the bench to see how the audio quality was for FM usage
and the improvement on weak signals. It look like a 6 to 10 db
improvemnet on the weak signal, since the audio was poor at this point
but on a full quietting signal the dsp down graded the audio. If there
was a way to switch the unit in and out of the circuit, it could help.

An other problem might be any tone signaling that you use over the
repeater might be impacted by the DSP.

Please forward anything of interest on the subject.

Thanks, Chris N6ICW

A repeater that has a 500Hz part in its freqency?? What ham 2 meter
rig could receive that? You could probably receive it on 145.762 or
145.763, but how could you dial in that freq directly? All of the
2 meter gear that I have seen can't dial in a frequency so fine.

I E-Mailed Icom (don't have the address handy), and they graciously sent
the schematic. They said they had some copied at a local copy house.
There may be a limited supply. It is a LOT of paper. I got the address
from the ICOM page on the WWW.

> Tom Randall Amateur Radio - KB2SMS

Hi Tom... Sorry to say; a lot of the Test Drive programs, do a auto baud
routine an will change, the TNC to computer baud rate.... Then when your
done, it won't work with the settings of your original program. The simple
thing to do is to check the baud rate in the program you always use, write
it down. Then when you try another program, check the baud rate its running
at <Abaud>. Then change the Abaud before you jump out of the test drive
back to your normal setting... A "LOT" of these programs use different
parms, so if you have favorite settings in your tnc, you'd better do your-
self a favor... Do a listing of your tnc settings an do a screen print out.
This way you can see the differences in the different programs an tailor
the parms to your liking...
Hope this helps...

>Bailey Computer Systems Radio Amateur Civil Emergency Service

Yes, King does indeed sell direct. At least I've bought parts and a service manual from them. User manuals they send for free! My catalog is apparently at work, so I'll post contact info for King once I retrieve it. My King radios are PRC-127's, a military version of their 14 ch VHF HT. On this they have an agreement with the government not to reveal any info, but they plainly tell you that for $25 you can have a service manual for the civilian version it was based on. And the differences appear to be labels!

549. Cubical quad antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-11 00:00:00 UTC
From: a0378@freenet.uni-bayreuth.DE
Message-ID: <9601110612.AA05560@btr0x7.hrz.uni-bayreuth.de>
Source record: 207497

Hello out there,

it seems that my good old High Gain Cubical Quad antenna called 244 is out
of order. This antenna did a great job for me. I bought this antenna
second hand and this puppy is about 17 years old. So it is time for me
to look out for a new cubical quad. High Gain do not sell this antenna
anymore and they also do not have any spare parts.

An old men told me about the US firm Lightning Bolt antennas so I ordered
information material. They offer a lot of quad antennas.
One Model they offer is calles 32 MCQ/WB which covers the 10-12-15-17-20
m band. For their antennas LBA use filament wound fiberglas for high durability and
strength. Spders boom plate and boom are mad of aluminium.

Does anybody use an LBA quad antenna?? How about the mechanical stability??
Here in bavaria we have sometimes very strong winds ...

A complete line of quad antennas is also available from CUBEX. I don't have
theirs brochourse yet. How about that antennas??

At least two of the members in my ham club have had bad experience
with Austin Amateur Radio Supply. One walked in with money in hand,
ready to drop kilobucks on a new HF rig, and they wouldn't even take
it out of the box to show it to him before he bought it...a wasted trip
to Austin. This is sad and I hope they correct the situation. I know
that not all ham stores are like this... I visited an HRO store in
California and the sales people were pleasant, helpful and great to deal
with. (I have no connection with HRO, by the way.)

Another two cents..soon we'll have enough for coffee.

I saw a new earphone/microphone setup for handhelds down at the local candy store. What was unusual is that the microphone is built into the earpiece completely. The product literature talked about picking up your voice through vibrations of the ear drum. The unit is made in Japan and is from a manufacturer I cant recall (no one major). Anyone have any experience with such a unit? I wonder how well the voice can be picked up and the quality of the speech.

> Does anyone have plans to build an interface for the FT-8500 to RS-232
> interface??

I've kind of wondered about this. There's the Yaesu product:
1) YAESU FIF-232C, INTERFACE FOR RS-232 COMM PORTS $109.95, In Stock
(listing from http://www.hamradio.com - cool price lookup system)

And, there's:
1) YAESU ADMS-2, PC PROGRAMMING KIT FOR FT-8500 $39.95, In Stock

That ADMS kit includes a cable that connects a computer to the 8500,
but the software apparently manages memory settings and things like that
but does not control the radio as documented in the 8500 manual.

I have always wondered if the cable that comes with the ADMS-2 is really
just as good as having the FIF-232C, and if one can write programs to
control the 8500 based on the RS-232 control information in the manual.

Then a computer could control the 8500 remotely, maybe in conjunction with
a repeater controller. Fun.

I noticed that the 8500 control command set does not include a command to
turn on and off cross-band repeat, though. Darn.

>anyone have this information?
>
>Thanks,
>mfogarty
That particular radio has several different models. The first three digits of the model number will tell a person which band it is on. To find the frequencies in the radio, you should look under the belt clip or remove the BACK cover and look underneath. If this does not produce a fequency list, you will need to take it to a radio shop and have the the prom read. You should know your own frequency and PL or DPL codes when you go. They can re-program the unit (probably for the same charge) at the same time (if the units are compatible). The shop I used to work at charged $35 to do this. You will probably have to go to a MOTOROLA shop to have this done.

I think the group has had enough of your public ramblings. My opinion still stands along with the developing opinion that the only reason you are here is to market your organization, sell books and subscriptions to your newsletter and contribute very little otherwise. It's your right and if anyone is remotely interested and has alot of idle time can reload the old articles and follow the threads.

Hi Eric. I've had one for about 6 months and it seems to work just fine. One annoying problem that I have is that when the squelch is closed (no "fm" noise) the signal meter drops to zero (no indictaion of signal). When you (I) open the squelch, the meter goes to about s-5 worth of noise (I'm only about 20 ft from main hydro trunk line). I presume they took the meter signalling *after* the squelch control. It's kinda nice once you get used to it :)

As for power, 10 watts gets me into a repeater about 45 miles away, using a home brew quarter wave about 25 ft on the side of a small tower. Using an 80 watt amplifier and the same antenna, nets me a repeater about 95 miles away.

Hope that helps. I also have the mod to increase the RX/TX range if you want it (opens it from 40 to 60 Mhz).

Best 73,

Tedd

Well, as long as there are no leaks......

>It is the *only*
>existing contact with ground in the attic. (other than the ac third wire
>neutral) The only other possibility is running copper grounding wire
>across the attic , out of the boxing, winding it down around the various
>contours of the house to a driven ground rod. The ground wire would be
>about as long as the antenna itself.

Long ground leads are not much good for RF, and you really don't need a connection to earth anyway for a RF ground. An RF ground needs a lot of surface area so it looks like a low impedance, not an earth connection.

>Now, the problem: The rf signals are getting into the ac lines of the
>house. The unit tunes well, tx's and rx's well. Very well. (Fed from
>an ICOM 706 rig. The signals come through some domestic household
>receivers (AM/FM Cassette, tv, vcr, etc., *even* when they are turned
>*off*.)

I'm sure the pipe is radiating, and everything is really hot with RF. Can you put some counterpoise wires radially from the SGC out like spokes on the attic ceiling or floor? Or lay down a large area of chicken wire, foil, or screening around the tuner?

And coil up the feedline from the tuner into the shack to act like a choke, and any other leads from the tuner to the shack or hose wiring so RF quits following the wires to other grounds.

You need a large low impedance electrically conducting mass up at that tuner. Especially if it is feeding a long wire or other unbalanced antenna.

> --
> Matt Clauson N0QXW Finger mec@ezlink.com
> mec@genesis.ezlink.com for PGP key.In my experience, there's no such thing as a GOOD pre-amp (I
assume you are referring to a receive Pre-Amp).

The problem with pre-amps is that the increase both the signal
and the noise. In order for the BOOST to be effective, you need
to increase the Signal to Noise Ratio (SNR). This is best
accomplished by getting a better antenna (A 3-5 element beam or
a 5/8 wave verticle for example). If you had to use a pre-amp,
you would want to install it as close to the antenna connector
as possible. This way you'd amplify the signal as much as
possible before inserting too much noise on the coax feed run.

Tim Smith - tsmith@ici.net - wrote:

BC>>I am not in the newsgroup for marketing. Radio is my hobby, too.

TS> Hmmm...you're becoming really incoherent....earlier your life,
TS> livlihood and family were at stake. No marketing?

Lying like you do......puts a lot at stake. What if I researched
and contacted your employer with........fabrications and lies like
you basically did to me? Got nothing to do with marketing, Smith.
It's lying.....between the gap in your buckteeth.

TS> Ok...we'll ignore the commercial, tag line, brag page or whatever
TS> you call it then...

Signature line? Filled with different ways to communicate with me,
which....by the way, a lot of people want to do. There's no
advertising in it. It's a helluva lot better than much of what I
see out and around. You don't like it or something? Does it
bother you? If so, check Parnass' signature line. Now there's some
advertising for you. No? I don't mind, but apparently you do.

TS> Good...you'll probably need them when sales dip even further....

What sales? Are you trying to hurt my sales? Suit yourself, but
you don't stand a chance. My bulk business is sales of oversize
condom rubbers for the overendowed. You couldn't possibly influence
my control of that market on a dream and a prayer.

If you want to stop me from writing books on radio hacking, well,
have at that, too. I can't imagine why, though, unless you are
downright jealous or too impotent to accomplish anything for yourself.

TS>...sure is strange how BP posted a few "familiar" articles today...

I've never read them, but will download them now for posterity.
I see where they are product reviews. I am not interested in
Parnass' product reviews whatsoever. Never have been. He does
things the way he sees fit, which is fine for the neophyte....
but of no use to me. Parnass addresses a wholly different audience
than I do, and ne'er the twain meet. It's no big deal, but I am
not interested in plagiarizing anything he has ever written.

If......and I say *if* he was the original author of that R71A
tuning technique, it was a total, random accident that I wrote
about it in the Montoring Times article of January, 1992. A fellow
in Las Vegas sent me the write up and GAVE ME PERMISSION TO PRINT

it. For all I knew, he was the originator. He still could be for all I know. Maybe he told somebody about it who told somebody about it who told Parnass? Maybe he picked up Parnass' article off the Internet? Maybe someone else rewrote Parnass' article and changed the credits? There is NO TELLING about that sort of thing.....

Now, are you ready for a bombshell? The article I printed differs substantially from the one Parnass posted to the echo. The title is the same...the substance is the same.....but the articles ARE different. Furthermore.....and clapse a deathgrip on your peanuts before you lose them, but Parnass' header states the article was from the April 1985,issue of Monitoring Times. What I wrote was for the January 1992 issue. Now isn't THAT weird on a couple of counts?

1) It would or should be painfully obvious that I would not knowingly "steal" something from the same magazine !!!!!!!

2) And it is mighty strange that Monitoring Times let it pass !!!

If this is the basis on which you levy your charge that I ripped off Parnass' stuff, then bend over, fella. There's nothing of substance to your bullshit. It was a compound accident over which I had the least amount of control. I'm not sure HOW I could have prevented it.

If you claim anything in my three books is Parnass' work, then get off your lying butt and spit it out so I can check into it. Don't get

your hopes up though, dingleberry. Everything in my books has been checked and doublechecked to make sure of sourcing and other potential conflicts. Clean slate there, parasite.

Forget Parnass' articles on the 2004 and 2005 and any allusions to cellular originality. I got one of the first PRO-2004's into this country in September, 1986, and had the cellular diode snipped and out within days.

(I had diode-programmed my PRO-2002 for the military air bands AND cellular back in 1981....and found that even though 800 MHz appeared in the display, the top end remained at 520 MHz. Bottom line is that I was hacking scanners long before there was ANY public knowledge that it was possible. I never wrote about it because no one was overly interested in scanners at that time.)

The memory and speed diode mods on my PRO-2004 followed immediately thereafter in September 1986. I was aware of these "discoveries" happening more or less simultaneously around the country. Pure, raw, discoveries, mine included, are not copyrightable. Only the published

wording of such matters is possible to copyright. There is no possibility of conflict with the routine "clip-a-diode" and "add-a-diode" typesof matrix programming hacks.

Aside from this simple shit, there's no conflict about anything else I wrote. It's ALL original by yours truly, with credit rendered to even those who sent me IDEAS to probe and explore.......names of Lynn Burk, Mark Persson, Milan Chepko, Terry Vaura, David Jones ....and many more who contributed however slight, to the information in my books. The names are THERE, clingberry. All you have to do is READ them instead of concocting malicious lies based on your axe to grind and a gamble that I'd be afraid to deal with you in public.

Parnass' name is not there, one because I hadn't heard of him before about 1992 after my 2nd book, and two, because he didn't contribute to ANY of the information or to my research. Simple as that. If he had, his name would have been there. There are several names credited in my books who I have never communicated with in my Life, but who I knew had been involved in the research or discoveries BEFORE I came up on the information. Read the books, DingleFritz: the names are there.

BC> You're saying Hobby Radio and notably scanning would be better off
BC> if you "killed me" or ran me off?

TS> No but your rhetoric use of profanity gets tiring and lessens the
TS> impact of your dialogs...

Oh. Well, did it ever occur to you that if it weren't for the lying sonsofbitches in this world, I might not feel like being so profane?

TS> You have a definite writing style that is truly unique...

Your spelling and grammar on a par with maybe an 8th grader. And a not

very bright one, at that. I haven't made mention of that little deficiency of YOURS until you chucked the first stone. Do take note of that.

> if you're not beating the thesarus to death

I don't use a thesarus. Don't need one.

> you're swearing...really make you sound intelligent.

Oh. Ok. I can live with that. I have always called a spade a spade,

and a shithead a shithead, and a lying sonofabitch a lying sonofabitch.
Mincing words isn't among my skills. Is that your problem with me?
Amd, ummmm, is English your native language?

Gentle, I did all the mods on the hm103 hand mic to no real satisfaction.

I kept getting muffled audio reports and weak audio.
I did a mod of my own and the results were dramatic. I opened the case, removed the rubber disk, then added seveal layers of tissue paper cut in shape of the case. This resulted in very clean audio. I stil wonder why this radio has all this mic. difficulty. I have asked Icom about what they recommend for changes. The radio also worked very well the SM6 desk mic. I would be interested in any other experiences of this type. I can be E-Mailed at prodigy at BSDS13A or Internet johnf@telect.com.

Charlie,

The CAP and MARS, lets a person know that peticular radio is modifyable to transmit out of the amateur band so that persons with Civil Air Patrol and/or Military Afiliate Recreation Station (that's close anyway) licenses can use that radio. It makes it nice because then you don't have to buy two radios!

I don't follow brand names much, but I think these are the rechargable alkalines, right? Anyway,
they do not have the same cyclability (cycle service life) that traditional NiCads do. I don't
remember the numbers, but the difference is significant.

Another avenue you might consider woould be Nickle Metal Hydride (nMh). These cells pack more
capcity in the same package than their NiCad counterparts. The down side is, thjey cost a lot
more and exhibit a higher self-discharge rate than NiCads.

>-----------------------------------

Hi, the JPS ANC-4 is rather remarkable. It really does work on powerline noise! You have to fool around with the antenna to get it right sometimes, but usually it is easy to do and MOST effective! It seems to tune in the noise with its own noise receiving antenna and then "inverts" it and let me tell you, it is amazing what it can do. In most cases it seems to eliminate noise from powerlines, tv sets, and computers. Does nothing for ignition or "pulse" type noise.

I've been using Sanyo 600mah for years, and I'm quite happy with 'em, but I recently received 6 Milleniums for the Pro43 for Xmas. Unfortunately, all of the shops that used to carry Millenium locally are gone, so I haven't been able to locate the 3hour charger. Apparently Gates (makers of Millenium) were bought by Eveready, but I don't know if Eveready are continuing with the Millenium line. Does anyone have more info on this?

Source record: 207427

In this reflector, VE6STV and others mention bad audio in both these rigs. I've modified both and indeed these rigs are VERY susceptable to high RF fields---to the point where the 890 must have an absolutly flat coaxial antenna match. The 757 was highly modified by KB6FPW and myself by placing thirty or so capacitors and half a dozen ferrite beads on all external connections. When this was done, that rig was simply marvelous. Apparently the FT890 is in even worse shape in this regard but the FT900 slightly improved as apparently the manufacturer paid SOME attention to the mods I sent specifically for the FT757!
As for the microphone mods, I simply could not make the provided microphone work at all regardless of the removal of rubber baffles etc. If one takes the microphone apart one will see that there is mounting hole provided for an electret microphone!! A Radio Shack unit fits perfectly. A small recharageable battery must be used, unfortunately. I connected the plus terminal of the battery, through ten kilohms, to the rear hangup plate. When needed, this plate was clipped to the plus 12 volts to charge the internal battery. Ground remained connected so only the plus connection was needed. If local RF could be kepted out of the rig, this resulted in really remarkable results in modified rigs, but I would be more than happy to hear from others on mods to the FT890 that would improve that rigs audio without the hassle of all those caps and beads!! 73

589. FT1000 and AFSK input help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-12 00:00:00 UTC
From: barry@w2up.wells.com
Message-ID: <o7TLHD2w165w@w2up.wells.com>
Source record: 207429

I am wiring a cable to use the HAL P38 digital mode board with the FT1000. The RTTY/PACTOR/AMTOR hookup is straight forward, thru the RTTY jack. CLOVER requires AFSK input, and I'm not sure where the best input is - Using the Patch In phono jack seems a reasonable choice, except that the mic input is in parallel with it. This requires the mic be unplugged for its use. Another option appears to be the Packet DIN jack, which has an Audio In line. The manual doesn't say much about this one. Is this input active when LSB is the selected mode? Is the Mic disabled when this input is used? Any other thoughts appreaciated... 73 Barry

I picked up a 3-hour "conditioner/charger" at rat shack for about $16 or so.
It is only for AA cells, and does a 1 hour discharge followed by 2 hour
charge cycle. Main drawback is you MUST do exactly 4 cells at once. I've
been using it with the rat shack 850 mAH (or whatever - higher capacity)
AA cells for a little bit and the results seem good.

I was advised that hobby shops sell super-fast chargers (for use with model
airplanes and race cars and such that use electric motors) and can get a
recharge in well under an hour, but I'd suspect this diminishes the cycle
life of the cells. I'm going to look into it, however.

How about

CAP - Civil Air Patrol

MARS - Military Affiliate Radio System

I think you can get into CAP without being an amateur radio operator but MARS would be difficult unless your active military. I'm not a member of either group, maybe someone who is will detail further.

Sure. SSB output power is proportional to microphone gain. Turn
the mike gain down, and your power goes down. Turn it down enough,
and you won't be putting out any power at all. Think about it.

I have one that I purchased used a few weeks ago. Both notches work smoothly and have a deep null. The peak filter makes a very substantial difference on CW, even with the 400 Hz IF filter that I use. Sometimes, signals barely audible above the background noise sound like S7 or S8 when the filter is switched on. The HP and LP filters also work well, although I don't use them much because my receiver has passband tuning.

On the downside, the peak filter does tend to ring badly, particularly when you narrow the selectivity control. This is most annoying when static crashes are frequent. The ringing that occurs when they "kick" the filter can really pummel your ears.

Unless you're prepared to much more than the price of this product for a good DSP filter, I think you'll find the Autek a useful accessory. Incidentally, I purchased their computing SWR meter (new) about a month ago also. Don't know how I ever lived without it. :)

>alternatives? Thanks in advance for advice!

With only 2 repeaters in range, you'd do much better buying
a GE PE HT, about $30 at a hamfest, and another $20 to crystal
it up for the repeaters. These radios are indestructable (cops
use them as substitute billy clubs), and have good enough front
ends to be used on an external antenna without howling intermod
(there's a slick car kit available). The same can't be said for
the Kenwood Gameboy.

Used amateur HTs that might also be acceptable would be the
Icom IC-2AT or the Yaesu FT470, the latter a dualbander covering
both 2 meters and 70 cm, though using it on an external antenna
would invite the howling intermod demon. Any of these choices
will be cheaper and better than the Kenwood TH79.

If you aren't wedded to the idea of a HT, there are any number
of good Icom, Yaesu, and Alinco "mobile" rigs that can be used
in the car or in the house with a 12 volt power supply. The
IC-28H would be a good choice, and not too expensive on the
used market.

In short, don't buy new, don't buy Kenwood, go onto the used
market and get a good commercial or amateur rig for lots less
money that will offer you much better performance.

That's not very "naroow". :-)

Icom has both in stock for the IC-735. The 500 Hz filter is also suitable for the digital modes, the 250 Hz filter is not. Going "naroower" than that, you're better off with an outboard DSP since it won't "ring". 80 Hz DSP is pretty standard, and there are specialty filters as narrow as 1 Hz for stuff like EME, but of course you have to send *real* slow to take advantage of them. If you go with DSP, use at least the 500 Hz filter in front of it to preserve IF dynamics in the radio.

Try a cavity bandpass filter in the feedline. Several have come on
the market recently in response to these wider than a barn door
HTs. Tucker Electronics sells one, and so does Alabama Radio. They
work. Of course you lose all-band reception capability, but what
did you expect? That's what's causing the problem in the first
place.

First they took the tuning knobs off the radios and made us buy
a separate "antenna tuner" box to get them back. Now they've taken
the selectivity out of our radios and require us to buy external
filters to get it back. Crafty, these Japanese.

Perhaps. Don't *assume* it's the battery. Get in there with a voltmeter
and *see* if it's the battery. These batteries last a long time. If
it is the battery, you can send it back for factory service, not too
expensive, or there's an outfit selling replacement memory boards
using NVRAM, gives you some more features too if you're into scanning
HF.

Source record: 207312

Mike,

All you have to do it is pull the control cable, the one with the 4 pin molex connector, from the back of the AH-2 controler and connect it to the like connector on the rear of the IC-706. The 706 tuner button now becomes the control button for the AH-3. Treat the AH-2 the very same asan AH-3. Using the AH-3 is described in the IC-706 instruction manual.

>dB. Thanks in advance for any info regarding what's available out
>there. Mark (AB6ZQ) mmonte@linkabit.titan.com

I haven't seen any commercial preamps with a "postselector" filter.
All of them I have seen have a "preselector" filter in front of the
active device to protect it from overload by off frequency signals.
And 30 db of gain is *far* too much for a single device, especially
an *exposed* device with no filtering in front of it. I have seen
preamps with a GASFET followed by a MMIC that offered that sort of
gain, but you'd better be driving lots of lossy coax or you'll run
the risk of overloading the receiver front end.

A preamp's duty is to set system noise figure. It should have no
more gain than necessary to overcome feedline and filter losses.
Good preamps are made by several companies. I like the SSB Electronics
units, but ARR, Tokyo Hi-Power, and Landwehr make good units too.

I don't have a temper in virtuality. I just don't play silly games and mince words. Neither do I share the idiotic opinion that it's "ok to be the aggressor, and wrong to defend...." This is how you and some others come off. I don't share your views.....

> I have read your books and columns and in the past had some
>respect for you and your efforts.

Oh gawd, here comes another threat now....

>your postings particularly with the challenges and foul language
>do little to shore up your public image.

I don't care about "image", liver-lips. Geez! What are you doing for YOUR image right now? When I saw your name in the message queue, you were a total neutral-to-positive in my mind. As I read down your needless and senseless post, the image I had of you shot like a rocket down to cesspool level. Two way street, man.

>. I know my respect for you has been diminished
>and I am sure the respect of others has also.

Age old syndrome....speaking for others so you can feel justified in taking a spit at me. Geezus, that's what makes you and me so different. You NEED the approval and "permission" of others. Leave 'em out of it. I can't talk to THEM and YOU, too. You are not empowered to speak for anyone. Marginally for yourself.

Oh......my respect for you has diminished as well. Here, write this down....or MARK-COPY-PASTE it to a file: I have no concern for people who play one-way streets. Your respect for me has no more significance than mine for you. If you are so fickle as to throw that leverage on me out here in a public forum, then you are among those elite few who have a standing invitation to eat my shorts.

It is a very simple and equitable deal, actually. No problem.

Now then, here is the crux of it all. Drop into the Lotus position and meditate upon the gunk in your navel and consider HOW you really don't care what I think of you.....and then place an EQUALS (=) sign next to that and ponder how I really don't care what you think of me. Here....if you are into math, this is what it looks like:

1 = 1

See?

Equality. That's the way it is supposed to be, right? But that's not how you stupidly come off......trying to leverage your respect for me into some sort of a power play in a totally unrelated business matter.

Geez, dude, I write books and do a few other things related to radio to help earn a living. You come off as me being inferior because of that. So what if I stop writing books and developing technical projects for people who can't do it themselves. Would that make me rise to your "do nothing" level?

So you want to cut off your nose to spite your face? Ok. I really can stop writing, if need be. But tell me......WHO will take my place? Would you get Andy Moss to write the next book for you? How about ol' Peter (PjB) Breath? Or that lying, conivving TSMITH?

Or how about YOU? Maybe you'd like to step in my place?

Look dude....come one....come all! Leave my books and my living OUT of this forum unless you need technical support. You are NOT going to leverage your brand of sorry, low-life thinking on me. This is not a Radio Shack store where I have to kiss your ass; wipe your snotty nose; and take your verbal abuse.....all for what, a sale? Aw, fer chrissakes, man......play like a cow turd and hit the trail, will ya?

I am not here for your stupid games. I am not here to sell anything to you. If you think I don't know what I am talking about, then ignore me and don't read or apply the information in my books.

If you would like to compete with me....then do that. I will HELP you! I love competition! I will help you find a publisher or an outlet for your goods. The more, the merrier!

But don't shake a stick at me. Don't threaten me. Don't leverage me. I will NOT deal with a soul on this planet but what it's a straight up, large-print kind of a deal, period. You want something in addition to the deal, then you spell it out in advance in the large print so I can see if I have it or not. And I damn well might not have it. I don't have something for everyone and don't pretend to; not like Radio Shack and other businesses to which you have become accustomed, who will do ANYTHING to dip a hand into your wallet.

From me.....all you get is a square deal and then ONLY if I get one. If that ain't good enough, then eat my shorts or go lay an egg......

Two-way street Bill

Now THAT *is* an opinion. Let me remind you how opinions, especially
unfounded ones, are a lot like rectums. Everybody has one, and they
all stink. You're sucking eggs, big time, on this one, fella, and
time will prove you dead wrong. THAT opinion bothers me not in the
slightest. You're right.....you are entitled to your opinions and to
express them.

So am I.

I have the following items for sale:

1. Astron 20-A linear power supply. 16 Amps continuous.
13.8 VDC. $75

2. Optoelectronics 2810 Hand Held frequency counter.
Range is 10 Hz to 2.4 Ghz $75

3. Palomar PT-340 Tuner-Tuner $50

4. Datong VLF Convertor...converts incoming VLF signals
to frequencies 28 Mhz or higher...For easy tuning on
normal communications receivers. $50

5. MFJ VHF 144-220 Mhz SWR/Wattmeter $15

All the above items work perfectly...I believe these are fair
prices, so you pay shipping.

>--Bill KB8USZ pruth@alpha.cc.oberlin.edu

You certainly don't want to use the Kenwood. At any *good*
receive site, the intermod will drive you insane. You need
at least a semi-pro radio, and preferably a professional
quality radio such as a Motorola or GE. Fortunately, suitable
equipment is dirt cheap on the surplus market. You can combine
a VHF receive strip and a UHF transmit strip in a single
case with some Motorola and GE models. This makes a compact
and easy remote link radio. Add a simple COR circuit, and
an IDer/timer, and you're done.

These radios will run forever at reduced power, no extra
heatsinking required. It's easy to turn down a GE, I think
most Motorolas are easy to turn down too, but I use mainly
GE radios. These radios are typically 40 to 110 watt units.
Turned down to 5-15 watts, they don't even get warm to the
touch after running key down all day.

>advertised on some HTs and mobile units?

They are code phrases to let people know that they can easily
modify the radio for frequencies where they aren't allowed to
transmit, IE that the radio is suitable for criminal purposes.

They also stand for Civil Air Patrol and Military Affiliate Radio
System, which are radio services where modified amateur radios
are allowed to legally transmit, using military frequencies,
with proper service approvals of course.

The Civil Air Patrol is a SAR auxillary of the US Air Force,
and MARS is affiliated with branches of the US military as
well, IE Navy MARS, Army MARS, etc. MARS is not the same
as a military recreation station, which must use ordinary
amateur frequencies on a US military base. MARS operators
use military frequencies, usually just outside amateur
bands on HF and VHF. MARS operation is primarily oriented
toward drill and training in military communications
procedures.

>73 de KC5EVD
>Billy

KC5EVD is correct you do not have to be an amatuer operator to join the Civil Air Patrol. CAP is the official auxiliary of the U.S. Air Force and as a part of its day to day operations and in support of it Search and rescue missions uses certain frequencies approximating the 2m band (ie 148.150Mhz is the nationwide primary CAP frequency). The listing of CAP/MARS in the tag line of radios infroms members of the group that the radio can be modified for use on their freqs. Being an amatuer is always good and CAP can always use more trained operators...if you want some more info drop me a note.

I'm not sure about MARS as I'm not a member

Thanx and catch you on the flip side

Amateur Radio Equipment For Sale:

Ten-Tec Omni-D 100 watt HF Receiver-Transmitter
Bands- 160, 75/80, 40, 30, 20, 15, 10 (28.0, 29.0, 29.5 MHz) Meters
Modes- SB-N, SB-R, CW
Extras- QSK, ALC, Notch Filter

This is a solid state 100 watt receiver-transmitter. At the time
it was built it was state-of-the-art and still has a good following.
It has a digital tuner with a digital frequency display (the D in
Omni-D).

Best of all it is 100 watts!!!

The RT was owned by a missionary in Colombia (REALLY!!) and is in fair
condition (scratches).

w/ manual, power connector and wolfman sticker

PLUS

MFJ-1278T (turbo) Terminal Node Controller
This unit does everything. CW, RTTY, FAX, Packet, AMTOR, PACTOR ....
It has the turbo (2400 baud) packet modem.

This is a Rev. 9 firmware which can be upgraded to the newer modes. (49$)
MFJ offers all kinds of accessories for this TNC: DSP, Mailbox Memory
upgrades, Real Time Clock, Etc. I will include an MFJ catalog.

I have used this TNC. (It logs on etc. but may need calibration which is
in the manual)

w/ manual, ac adapter, serial cable, and non-original box (wrong sn#)

The radio is valued at $400 (by Ten-Tec) and a used 1278T is worth $150.

I am offering BOTH for $500, very negotiable
You will never get a digital station this cheap!!

Terms COD CASH plus shipping (I will double box)

If I cant sell both I will keep both.
I DONT REALLY WANT TO SELL BUT I NEED THE MONEY!*@!#@!!!

>charge cycle. Main drawback is you MUST do exactly 4 cells at once. I've
>been using it with the rat shack 850 mAH (or whatever - higher capacity)
>AA cells for a little bit and the results seem good.

I have several very big philosophical problems over the design of such a charger.

If you have to charge 4 cells at once, then you can bet they're all wired in series. What about the discharge cycle? I HOPE it terminates before 1 hour if the total voltage falls below 1 volt per cell, because continued discharge will ruin the weakest cell through reverse charge. This can happen in a MILLIsecond, folks!

Of course, the success of a discharge cycle so designed, must depend on all cells having equal capacity (both rated and ACTUAL) or else one of them will surely go dead before the others, as pointed out above. Suppose your device only uses 2 cells? or 3? How do you charge (or discharge) them in this device without ruining one?

A charger having a fixed 2-hour charge cycle will only properly charge cells having ONE capacity. Cells having a higher capacity will not charge fully in 2 hours. Cells having a lower capacity will be cooked.

The capacity the charger is designed for is easy to figure out: look on the back and see what the charging current is and multiply it by about 1.4

For instance, Radio Shaft's older 2-hour charger put out 350 mA, which means a 2-hour cycle PROPERLY charges only 500 mAH cells. Higher capacity cells would need a fraction of an additional charge cycle, which means you'd have to disconnect the charger manually before the end of the second 2 hours, or else your cells get FRIED. Lower capacity cells (like their older 450 mAH penlite cells) are pretty much out of circulation ... but these would be damaged by overcharging well before the 2 hours are up.

Bottom line: not with MY batteries, you don't; Radio Shaft!

>
>I am trying to get into VHF/UHF ssb work and don't realy know the equpment.

The IC900 is FM only. It used a stack of band modules that you could
buy separately, had a remote head unit connected to the radio mainframe
by fiberoptic cable, and was orphaned by Icom when the IC-901 came out.
Major bummer!

To find out about what radios are available and what they do, the
ARRL publishes _The ARRL Radio Buyer's Sourcebooks_ which are
compilations of all the QST product reviews for radio equipment from
1981 through 1992, plus a few golden oldies. I believe CQ publishes
something similar.

If your library gets QST, searching through back issues can get
this information free. If your library doesn't carry QST, why not?
Give them a gift subscription if you have to.

This new classified page will allow Hams to find equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear you'er interested in, you are also provided with easy point-and-click e-mail access, directly to the Ham that listed the item.

For those Hams with gear to sell, take note! there is NO charge to list your equipment within Ham Classifieds, and there will be no posting time delays. Your posting(s) will go on-line in our classified search engine immediately. All you need do is fill out a simple forms page, and upon its (point-and-click) submission your "For Sale" classified is immediately on-line.

```
I will be purging the classified listings initially, about once every
month, but that timeline will shorten as our classified numbers grow.
```

Give it a try, and let me know how you like it (we are still beta testing)

Seth, I don't know what to tell you... There are many decent repeaters out there and people have had luck using many of them. Make sure you take into account the required power you will need and the range of your antenna.

Most of all, good luck. You're starting a complicated project but it will be rewarding in the end (not to mention a great service to your area!).

Is there anyone else here who can help Seth with the technical aspects?

632. Re: SGC-230 Ground????

Attic HF antennas are NOTORIOUS for creating severe interference on just about everything in the house due to the proximity to A.C. wiring that is ALSO usually installed in attics. It will do everything from lighting hallway lights, to powering speakers - whether the actual appliance is turned on or not. It's bad enough in a single family home, but catastrophic in a condo, or apartment complex - the neighbors WON'T be sympathetic! I have a SGC 230, it works great, and is not the problem in your case, the installation IS. The farther away from house wiring you can put the actual antenna, the better. Consider the use of very fine copper wire - it's VERY hard to see, but radiates as well as the big stuff, and might permit installation farther away from your house without being conspicuous.

I've had one for about a year and a half. It works quite well and the Baycom software is really slick--multiple channel connects, channel activity monitoring, etc. It makes for a perfect portable packet station along with a laptop and ht. Well worth the $$$. HOWEVER...if you are going to try to integrate your hf station with packetcluster control, the BAYCOM is not the answer...it won't work. I use regular tncs for the home station, and keep the baycom for travel and bbs check-ins. Get one...you'll have a lot of fun with it. And the regular software that comes with it (ver. 1.4) works just fine. GL/73 de Rick, N6CR

That's a violation of the National Electrical Code, dangerous, and
your homeowner's insurance is void if they find out. Go disconnect
it right now, then come back and we'll talk.

//

//
Ok, now that you're back, we can talk about a safe antenna installation.

>The tuner
>is mounted in the attic in a large two story house. It is the *only*
>existing contact with ground in the attic. (other than the ac third wire
>neutral) The only other possibility is running copper grounding wire
>across the attic , out of the boxing, winding it down around the various
>contours of the house to a driven ground rod. The ground wire would be
>about as long as the antenna itself.

Good. Then it would make an effective counterpoise. You can omit the
driven rod if you like. It won't do you any good.

>Now, the problem: The rf signals are getting into the ac lines of the
>house. The unit tunes well, tx's and rx's well. Very well. (Fed from
>an ICOM 706 rig. The signals come through some domestic household
>receivers (AM/FM Cassette, tv, vcr, etc., *even* when they are turned
>*off*.)
>
>I need help. Thanks.

I'm not surprised. In the first place, attic HF antennas are lousy
antennas, and unbalanced attic antennas are worse. *Of course* you
have high RF fields throughout the house, and *of course* you're
getting into everything electronic with your signals. If there's
any conceivable way, you want a *balanced* outdoor antenna. A 105
foot or so flattop fed in the middle with balanced line would be a
dandy all band antenna. It'd get the high RF fields away from the
house, and because it's balanced, won't require any kind of ground
connection at all.

If you absolutely can't get the antenna outside, then use as long
a balanced flattop as you can mounted right up against the attic
peak. Feed that with balanced line, and reduce power until the
RF fields are down to a safe level in the house. Don't even think

about using an unbalanced antenna in your situation.

649. Ten-Tec 1208 6m Xvtr

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-13 00:00:00 UTC
From: an142028@anon.penet.fi
Message-ID: <013309Z13011996@anon.penet.fi>
Source record: 207449

Just a quick post to echo those who have built the Ten-Tec
1208 kit and found it well-designed & documented, fun to build,
and worth the price. It's an easy way to get on 6 meters (in my
case, back on 6 after a 17-year hiatus). I get 10 watts out of
mine (per the Bird) without any tweaking other than normal tuneup
per the manual. The "driver" is my IC-735, suitably tweaked down
to 5 W out on 20 meters (with a *BIG* warning label to remind me
not to forget to turn it down!).

Now for a homebrew "brick" so I can *"REALLY* hose down
Channel 2..... ;-)

73,

Paul, K4MSG

P.S. If the person who bought my P-P 6146A 6-meter amp in 1979
reads this: Still have it? Wanna sell it back to me? Oh, well,
guess I'll have to rebuild using a '90s approach - a board, a
hunk of silicon, and a big heat sink.....

>filters it is a perfect, self-contained rig for portable use.

The receiver is prone to overload though, probably not a problem
on mobile antennas. The IC-735 is a *much* better rig, but the
old IC-745 isn't bad if you stay away from strong signals. I like
the way the PBT and IF shift work on the 745 better than the 735.
BTW modern rigs are rated by their power *output* and the IC-745
is a 100 watt radio by that measure.

About $150, $200 if it's really nice. Good radio in it's day, easy
to use, rugged, but it's bigger than the current crop and that hurts
resale.

Gary

Hmmm,
Perhaps in your own eyes or your own opinion, but not mine.
I think Bill has demonstrated an effective and efficient way to
deal with slander on the internet. If Bill's response has some
shock value well "...heat...kitchen..." get it .;-). What is
wrong with some demonstrative indignation? Most internet slanderers
pick on victims who have no voice for defense on the net. These
goof balls pick on Bill who not only has a voice but can put some
fire behind it. Seeing the reaction of the slanderers to Bill's
rebuttals has been amusing.

Best regards,
wynnt

>mod to fix this and was wondering if someone could forward the
>mod to me or point me to a site where I could get it. My HT and
>scanner can rcv NOAA while the 706 cannot, so something's not
>right. Other than that I'm so far real pleased with the rig.

It's the famous "yellow wire" mod. When you take off the top
cover, you'll notice a connector in the center of the radio
with a number of colored wires coming from it. The 4th from
the left is a yellow wire. Remove it from the connector. That
will improve receive above 148 MHz. Unfortunately it trashes
receive below 120 MHz (on VHF, this mod has no effect on HF).
So you have to do one more step. Turn the radio over and remove
the bottom cover. At the front edge of the circuit board, you'll
see 5 tiny SMD transistors. There's a trace coming from the middle
one going over to near a connector on the right of the board. There's
a feedthru hole there. Extend the yellow wire you disconnected in
step one, and solder it to this through hole. Now you'll have proper
behavior below 120 MHz too.

>Also, does anybody know where I can get more info on the computer
>interface? Do I need to buy a level converter even if I don't
>want to use my PC as the controlling device (i.e. other controlling
>devices that use TTL levels)?

As long as they are Icom C-IV compatable, just hook them up.
Make sure the addressing doesn't conflict, and be wary of
the IC-735 which requires a different data format, menu
selectable on the IC-706.

Note that the C-IV bus is a *party line* which may have
contention, devices hooked to the bus have to be C-IV
compatable or smoke may roll.

Overall a good little radio. Difficult to program as are most of the
newer radios. Easy to accidently hit the wrong button and not know how
to get out of it. Best feature is the 900 MAH battery. It seems to
last forever.

Source record: 207262

Hello, a visiting ham from Texas described to me how they are setting
up high speed (10mbit+/sec) links using 10 GHz transceivers. He told me
I could even use a grocery store-door opener as the transceiver. I
picked up 3 txers at a hamfeast (Uniontown, PA) for $10. I assume I
need to build a pair of parabolic dishes to spec.
Is there a possibility of mixing a 1.5Mbit/sec sine wave onto the
RF signal?

ANY info would be of great value. Thanks - Tim

Hi,

> Hello, I'm looking for a ZVEI decoder.
> It decodes the "5-tones" produced by taxi and ambulance radio's.
> A hardware or software solution is welcome.
> thanks and 73 from Geert.

I designed such a circuit.
Features:
- 7-segment-LED display
- optional alphanumeric LCD to show the names of the alarmed unit
- serial (RS232) inferface
- up to 8 relays can be connected, they switch if one of five "5-tones"
is recieved (programmable via RS232!)
- you can get a list of the 1000 last "5-tones" via the RS232

It's a very cheap solution, parts cost only 60-80 Deutschmarks.
Unfortunately I wrote only a German manual, but if there are enough people
interested, I'll try to translate it (but my English is not very good). If
you want to have the schematic, layout (EAGLE) and German manual send me
an email and you'll get it uuencoded.
I also sell ready-to-use decoders (150DM), PCBs etc.

Flip

From: jds@neptune.net
Message-ID: <4dc2d7$2td@neptune.neptune.net>
Source record: 207276

Speaking of Ten-Tec Transverters...

I am building one now, and plan to use it with my FT101E. The FT101E has an "RF Out" jack on the back, which is the output of the driver stage just before the final amplifier tubes. It seems the safest thing to do is try and use this output, which was provided for Yaesu accessory transverters.

I have pored over all my 101 docs, and I cannot determine the output power of the RF Out jack (I also have the service manual). I do not (yet) have the test equipment to measure it directly. The best clue I have for now is the input spec for the Yaesu 6m transverter, which is listed as 3Vrms/10W at 28-30MHz. I don't expect the RF Out jack to have the same characteristics at 21MHz (required by Ten-Tec). Also the Ten-Tec's upper limit is 10W, and I'd be happier operating somewhere less than 10W if possible.

Has anyone within the sound of my post used the Ten-Tec transverter with an FT101E? I plan to continue researching this with Ten-Tec, Yaesu, and get the equipment to measure directly. I'd just like to compare notes with anyone who's done it before!

(by the way, I am interested in both SSB and CW operation.)

thanks & 73!

I have for sale a Sinclair 4 cavity high power VHF duplexer Model# Q-202GC. To my knowledge it's never been used. The cavities are inclosed in a steel cabnet with (3) three conectors on the side. The frequency tuning range is from 132 to 174 Mhz and I have the complete tuning manual.

The Electrical Specifications are as follows:

INSERTION LOSS= Tx 1.5 db
Rx 1.5 db
ISOLATION, Tx Noise at Rx frequency = 80 db
Tx Frequency at Rx Terminal = 80db

MINIMUM ISOLATION Between Tx and Rx Frequencies = 50db

MINIMUM SEPARATION = 500Khz

This is a top of the line duplexer and lists from Sinclair for $1730.... I will take $850 or best offer. This is for local pickup or I can deliver within a 100 mile radius of Chicago Il.

You can "E" mail me at turtle@wwa.com

684. Info Needed on World Radio Laboratory and Globe Products

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-14 00:00:00 UTC
From: ittg@cerfnet.com
Message-ID: <ittg-1401960042130001@206.17.248.58>
Source record: 207348
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Could I get your help in locating information on the products of the World Radio Laboratories (WRL) of Council Bluffs, Iowa. A book is now being written on the life of founder Leo Meyerson and WRL. WRL built and sold popular amateur transmitter products and electronic parts from 1937 to 1972. Originally known as Wholesale Radio Labs before WW II, WRL sold the popular Globe King, Champion, and Scout Transmitters now prized by collectors.

Although many WRL catalogs are in the Amateur Radio Collection at the Omaha History / Western Heritage Museum, a number of catalog years are missing:
1937,1938,1939,1946,1947,1948,1950,1963,1968,1972. If you have these catalogs, would you contact me for some questions? I want to index product model numbers and prices for each year.

Also, does anyone know the wherabouts of Samual J. Fidone, the designer of the WRL Globe transmitters during the 1940's and 1959's? His call sign was W0QAB.

Thanks for any help!

Mod for expanded RX/TX for the HTX202

Buy another HT with expanded RX/TX, and duct tape it to the back of the
HTX202. There you have it, expanded RX/TX.

To date, it's been said there are no mods for the unit (other than the
above)

:>input active when LSB is the selected mode? Is the Mic disabled when this
:>input is used? Any other thoughts appreaciated... 73 Barry
:>

The FT-1000 Packet IN audio is only active when the PKT mode is selected. Normal mode in PKT is LSB with the display offset to show the center of packet tones (selectable by the DIP switches under the top "hatch").

One will notice that depressing the PKT mode switch will light both the PKT and LSB LEDs. Switching between LSB and PKT when listening to a marker (carrier) will show no change in tone but a shift in the display corresonding to the selected display offset. I suspect the offset can programed to match the Clover center frequency, if desired.

The unit that I have is made by EAR-MIKE but I do not have an address. The unit works on the principal that the human bone structure resonates with sound therefore if you can get something up against the bones then you can "pickup" the sound...I use mine when wearing a self contained breathing apparatus (SCBA) and it works very well. It has a ptt box that I wear on my waist with a BIG button on it such that I just tuck my elbow up against my waist to hit the button and voila! It is not as loud to the end user but it is better than the muffled shouts thru a mask into a radios standard mike...The only drawback is the cost...Mine set me back about $400.00 with the Mike, int/ptt box and radio cable..Extra radio cables were about $125.00 when I changed from MX to MPD.

Hope that this helps

Mike

> >memory.

I have a 870 and I've been spending a little time with the
control software that comes with it. The software is very advanced.
It is objected oriented. You can control virtually every aspect of
the radio, including menu items that aren't normally controlled from the
front panel. You can certainly create virtual radio's, like one for
shortwave listening - where all of the stations are selected from a
pull-down menu, or whatever. I have found it usefull to program
some of the DSP parameters, to learn what effect they have on the signals.
Programming is done in a mostly graphic environment, where you
place push buttons, meters, dials, switches, keypads and the like on the
screen. Then you enter very simple code that tells what these switches
do. The complexity of this can vary from a button that turns the rig
on and off, to a button that will go to a specific freq, on a set antenna,
with the filters set just so, and the mode, the attenuator, speech
processor settings etc etc.
The manual that comes with the program is bare minimum - almost
100% useless, but there is a pretty good help file and tutorial.

> >How versatile is the Radio Construction module. It would be nice to
> >build your own radio on the computer screen and only use the features
> >that you want or need. Operation can be as simple or complex depending
> >on your needs. You can build different screens to accomodate your
> >operation at the time.

It will do this if you want, but the person how does this is
probably a pretty computer capable person, and one with a lot of
patience. For me, it is a blast.
The program developers have a web page and there was a promise
of radios being posted, but I've not seen any yet.

I think the 870 is a great piece of equipment. It is amazing how
you can control the selectivity. I regularly use the 250 Hz filter on
Pactor with full data rates. I'm not a CW person, but it this would be
a great rig for such people. You can have tunable 50 Hz filters with
virtually no ringing. It's almost enough to make me want to practice
my code, but playing with the computer program is more fun, for now at

least...

697. Looking For 900mhz atv eq

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-15 00:00:00 UTC
From: n0nas@hamlink.mn.org
Message-ID: <821735979.AA04996@hamlink.mn.org>
Source record: 207211

RI>From: richesop@cici.com (Peter D.Richeson)
RI>Date: 2 Jan 1996 01:23:11 GMT
RI>I am looking for some 900 MHz atv equipment. I want to put up a
RI>900 MHz ATV repeator. So far all I can find are converters whos
RI>output is TV ch 3 or 4. I need baseband and will need both rec
RI>and transiter. Can any one help.

From the Summer 1995 issue of ATV Quarterly magazine, PC Electronics has the RTX-33 crystal controlled 1 watt 900 MHz AM ATV transmitter for $330. The matching ATVR-9 crystal controlled 900 MHZ AM receiver is also $330. Both are nicely packaged in 7.5"x5"x2" die cast aluminum boxes. Both operate from 13.8 volts DC and have baseband audio and video inputs. We have a pair of these units in our RACES unit. We have the transmitter configured as a portable transmitter with an added 18 watt amp. They have been quite reliable and all problems have been due to our wiring. I only wish they had locking shafts on the level control pots. P.C. Electronics is at 2522 Paxson Lane, Arcadia, CA, 91007-8537. They have a 10 page catalog and 8 page repeater app note they'll send if you call (818) 447-4565. This is only one vendor amoung many that advertise in ATVQ.

You might also want to give serious consideration to 900 or 1200 MHz FM ATV rather than AM. In general, the AM signal may give some sort of picture on the weakest signals but the FM signal will give significantly better pictures for fairly modest signal strength improvements. The local hams are finding better pictures on the ATV repeater with 1200 MHz FM input rather than 439 MHz AM input. The only problem is finding a good crystal controlled FM ATV receiver for the repeater!
(P.S. Did you know that most cell site antennas have good response well into the ham band? Do you know any cell site technicians?)

I also highly recommend ATV Quarterly magazine for $16 per year.
The ATV Secrets books Vol 1&2 for $29.95 + $3.50 shiping is another good idea. ATVQ is at 3 N Court St, Crown Point, IN, 46307.
Don't forget that repeaters should be coordinated with your state's Repeater Frequency Coordinator. You can find his address in the ARRL Repeater Directory or from the ARRL staff.

Good luck with your project. 73's.

My wife just got her tech and we bought two Yaesu FT-51R HT's and love them. With the 2 watt battery they are very small and even with the 5 watt battery they are very "carryable". To get the size down just a tad bit more, I chucked the Yaesu antenna and bought two Maldol AH-209S dual band rubber ducks which are only 3" long. With the 2 watt batter and 3" antenna the thing is small enough that my wife will actually carry the thing when she goes shopping at the mall.

: Seth, KB2WLU

For a 2M repeater, your first step should be to check with your local
frequency coordination group to see if there are any available
freqency pairs. 2 meters is pretty well filled in your area and
you could end up buying equipment only to have no open freq to
put it on.

gud luck, dave wa3u

It figures ! Icom really seems to count on the profit margins of
the options...and to make some of the normally standard but necessary
items options assures them of the sales.
I was going to make up my own remote mounting cable for my 706 like I
did for my Kenwood TM-741 but the engineers at Icom made sure to
do a good job of designing non-standard pressure contact connectors.
They're of high quality but pretty difficult to duplicate without
spending a lot of time in a plastics shop. I guess I'll be forking out
for this one (the dealers want $100 Cdn for it !).
I'm a homebrewer at heart..if I can make it rather than buy it, I will.
BTW Gary...I've sent you a couple of e-mail messages in the past month
or so...is your e-mail working okay ?

Regards...Hugh Duff VA3TO Toronto

Programing cables are a readly available part. If you communications
wont sell them, or is *charging* you to program these radios, they
are ripping you off. (our local shops wont charge if you buy equipment
there)

If you want a cable, contact STINE ELECTRONICS (406) 677-2148. Talk to
Bob Stine. He is very reasonable.

I'm looking for a dead nicad battery back of the type which fits an ICOM IC-2A(T), and the Radio Shack HTX type portable radios. This pack slides onto the bottom of the radio, and has a 12v barrel type jack built into it for connection the charger.

Why? I have an old IC-2AT, which does not have an external power jack. If I can find a dead ni-cad pack, I will remove the nicads, and replace them with a power filter, allowing me to operatte the radio from an external power source connected to the chargeing jack.

707. HT recommendation (?)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-15 00:00:00 UTC
From: jcupples@iphase.com
Message-ID: <jcupples-1501962209250001@va-dyn30.iphase.com>
Source record: 207221

After many years of interest, and listening to SW and 2M stormspotters in the Dallas area, a friend finally convinced me to go to a local class for the novice/tech no-code license.

I find that given Ohms law and Algebra I, I can expect to pass. Finally finding benifit in taking 5 semesters college calculus. Ladies in class very impressed by my math abilities. So planning for the hopeful new callsign in Feb is in process. Must learn 10M novice freqs sometime!

Wife detests existing home computer stuff and radio receivers, thinks all are waste of money and ugly. Knows ham gear is even nerdier, moans loudly at prospect of finding new spot for HF rig and big antenna.

Plan by telling her various places where it could go, she hates them all. Tell her OK, will sacrifice and buy only HT and maybe mobile rig sometime. She immediately agrees happily, her home decor will suffer very little.

Note strategy: I had no immediate interest in HF rig anyway. Brilliant scheme unfolding, few hundred $ is stashed away for purchase.

Ask around, many opinions.

1) get 2m/70cm dualband rig (many repeats)
2) brand X is crap
3) brank Y is crap
4) brand Z is good but way too epensive, hard to use.
5) brand X is great
6) brand Z is crap

Disregard most of above, consider building own rig to impress other hams with knowledge of PC layout and operation of SMT pick and place machines/reflow soldering. Future ham conversations will be great.

Too lazy for above, though. Want neat, small unit, works good, will not break soon and impress other hams when hanging on belt. Home brew would likely create too much smoke anyway. Various FCC concerns a possibility.

So please, any real experience with the following:

Kenwood TH-79(D)
Alinco DJ-G5T

Are these reliable, sound OK? Which options/accessories worth getting?

Intend to possibly participate in Skywarn nets, light use otherwise, probably casual use only. Want it to work well, not break. Like neatness, not afraid of reasonable complexity. Seems to me first drop may break unit, fear high cost of repair.

Appreciate your knowledgeable advice...

Hi,

I've got a alinco dj-580 handheld that appears to be playing up.
When i turn it on it works ok for a few seconds, then it seems to go deaf on
2, and not transmit on 70 (but still tx's on 2, and rx's on 70). I have noticed
that when it is acting up, and you tx on 70 (or at least try to :-)), the on airlight
flashes.

has anyone got any ideas what wrong?

I am looking for a panel meter for measuring AC line frequency for a generator. Years ago, Simpson and Triplett made vibrating reed meters, and more recently, I have seen an analog panel meter made by Modutec (but I don't know how old it was).

Any one have any suggestions where to find one, or have suggestions for a quick and dirty frequency counter with a difital display?

Responses to my address below much appreciated.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

>RF signal?

The short answer is no. These intrusion detector units do not have
a separate modulator diode, so you have to impress modulation on
the gunn diode regulator (a 7808 or such like). Those only have
a gain/bandwidth product sufficient to pass audio frequencies.
(An easy way to do that is to place the secondary of an audio
transformer in series with the common leg of the regulator to
ground. Feed audio into the primary, and the gunn diode voltage
will be modulated.) To get sufficient modulation bandwidth for
high speed data, you need the Microwave Associates Gunnplexer.
It uses a separate modulation diode and can handle high rate data.

Your units have two diodes, the gunn diode and the detector diode.
The MA units have three diodes, the gunn diode, the modulator diode,
and the detector diode. It's barely conceivable that you could
modify your units to add the third diode, but I couldn't begin
to give you detailed instructions on how to do that. Diode placement
and diode type are *critical*. You'd need a milling machine or a
very good drill press with an X-Y table to have any hope of locating
the third diode properly. That is, *after* you figured out where
"proper" is for your units.

It's also possible you could use a different gunn regulator
design that would allow you to impress the high rate modulation
on the diode bias voltage, but that would very likely make
the gunn oscillator unstable (as if it is stable anyway)
and make performance very poor.

There are two adjustments on the IF unit, T2001 and T2002. Connect a DC voltmeter to TP2001, inject 14.2MHz (they say 20dBu..?) and adjust for min voltage on the meter. The adjustments are just about impossible to get to without an extender board. I tried adj. and putting the board back in for some noticeable improvement.
Same deal with the notch. L2010 and VR2007 (you can get to it), and tune for min s meter reading.
The extender boards (3 types) are about $275. The connectors are expensive....I didn't seriously consider making them. In fact I never found the connectors as parts anywhere. Anybody know?

internal adjustments as per alignment instructions? I had to tune up
both my TS850 and FT990 in that way and greatly improved the
performance of both radios. On the 990 I was only able to reach one
control due to the requirement for extender boards, but it helped.

I'm thinking of getting a Icom 706 in a few weeks time. Just wonder if anyone out there has it and would like to hear some comments.

Or is there somewhere on the Net I can grab any info? And Yes I've gone to the Icom Webpage. Nothing there but some nice radio pics.

Thanks.

I picked up a nonworking Clegg FM-27b at a hamfest and with a little
cleaning and repair got it on the air. I'd like to find at least a
schematic or a copy of the whole manual.
It's probably not worth anything but it works pretty good for a 25 yr.
old rig.

John, I have had similar experience with my FT-1000D and It is about
four years old . The nb level adjust does little to adjust the level
of blanking. This is the only shortcoming I have with the equipment.
I love the radio but to overcome the above I use the MFJ-DSP with the
radio and get excellent results. Regards, Bill, W5BBR.

YES this is the same Atlas radio that took buyers funds on a pre-
distribution basis and still hasn't delivered product. That situation
has not been resolved. The guy is Herb Johnson, and in all fairness, he
is the guy who's company built your 350-XL way back when.

>
>Jim
Hi Jim,

Joe here from Bravo Victor Two land. ADI is a product of Taiwan.
They are an OEM producer of several VHF and UHF handheld transceivers.
New for 1996, they have introduced both a VHF and a UHF mobile transceiver
in addition to a dual-bander.

Designs of the handhelds are from Standard (Japan) and the VHF / UHF mobile
rigs resemble the Kenwood TM-x41 series. Appearance is very similar, as is
functionality.

Quality has vastly improved from earlier models, and considering the price
versus the name brands, it seems to be a good route to go. Of course, the
resale value may be lower since you dont have a "name brand", but in todays
world of value concious hams it's worth a bet.

They are all over the place here in Taiwan, used in commercial and amateur
service. Taxi drivers especially seem to like them.

Need more info? Email me at joentam@transend.com.tw for more details.

73,

dit dit

I have one of these beauties, As the others have already said, it is a
dead ringer for powerline noise, horizontal osc noise from TV's, computer
noise, etc. I love mine, and it takes the local noises completely out
(from over S-9 at times!!) and I hear things that I didn't know were
there. My NIR-10 DSP works better with it, too.

I have an old Yaesu FT-901DE HF rig. It is basically the same as a 901 DM, but without the memory module for split operation. It already has the cables, front panel controls, etc, and the memory module could have been added later...but mine never got it. Yaesu says that the module is no longer available. Does anyone have an old junker 901 DM that I could buy the memory module out of? Module condition isn't important, as I can repair a defective unit...I simply need a starting point.

Thanks!

I have been using this radio for about two years now in Civil Air Patrol and amateur radio service. I have been completely happy with its operation. Although it is dual band, I generally use it in the Vhf/Vhf mode. This allows me to monitor two vhf freqs at the same time. This is done primarily in CAP when we are operating on one freq for aircraft and another for ground teams.

The radio comes equipped with CTCSS encode and has decode as an option. I would highly recommend that you get a radio with the encode function. Many repeaters require CTCSS for access. The decode is another story. I use it on my mobile rig to eliminate a lot of intermod when monitoring my club's repeater. Our repeater transmits a CTCSS code and you can set your decode to only respond to it. This is not a problem usually for my H/T. With its small antenna, it usually is not subject to the intermod problems.

Is this a good radio for a beginner. It has a LOT OF FEATURES. This can be a challenge even to experienced VHFers. If you have patience and maybe a source of help (read as "Elmer"), you will probably very happy with the radio.

Best of luck and 73,

P.S. - Don't leave home without the owner's manual. o<:-}

If you can get by without the DTMF pad, The Standard C508A Dualbander is pretty nice. If you look at the measurements, it doesn't look much smaller than the competition. But when you stick it in your shirt pocket, you still have room for your sunglasses. Borrow a handheld and run it on low power to make sure that 200mw is enuff to do what you want. I've got a stack of higher powered, more featured handhelds, but they're all siting on the shelf since I got the 508.

Hello all, I'm trying to get my amature radio license and would like some adive on a good rig to save up for, being a student funds are *very* limited. Would the secondhand market be a safe bet? Is the label on the box important (obviously Yaesu and Kenwood are decent but their prices can defy belief!). Would making my own be a far better solution (obviusly more fun)? Almost all the designs for radios require expensive (variable capacitors) or difficult to obtain items (some of the ICs).

Laurens

From: randolph@est.enet.dec.com
Message-ID: <4dgkti$4vm@mrnews.mro.dec.com>
Source record: 207165

My wife's Yaesu FT2400 has the following problem...

Transmitting on mid or high power, audio starts out clean. About 30 seconds into transmitting, the audio gets covered by a scratchy hiss, much like wind blowing across the mike. A hiss can be heard from the FT2400's speaker while transmitting when this occurs. About 1-2 minutes later, the noise goes mostly away, appearing only occasionally. No problem at all on low power. I suspect a bad joint in the audio chain somewhere... My father-in-law's FT2400 does the same thing only to a much lesser degree, so I expect someone out there will have seen this problem. If anyone knows the fix, please post!

Source record: 207166

Neither the Heath SB230 nor the COllins 30L1 are contest-grade amplifiers, and neither will handle "key down" service for more than a few seconds at full rated power. However, given a choice between the two, I'd definitely go for the 30L1. There are basically three reasons: (1) it is better made, with higher overall construction quality. (2) It is favored by collectors, with a resale price that will either be stable or increase over time. And (3) the replacement tubes are inexpensive and readily available. See Bill Orr's review in November CQ for caveats.

From: bwight@ix.netcom.com
Message-ID: <4dfu9l$hpv@ixnews8.ix.netcom.com>
Source record: 207167

Advice wanted:

I am trying to receive AM radio stations' signals in northern California (I'm in southern California) with ordinary stereo equipment. Powerful stations like KGO (50,000 watts?) I can receive almost perfectly (at night). Other stations I try (at night) are either barely audible above background static (which makes it impractical to listen to) or weakly fade in and out while periodically being overtaken by some other signal (usually some weird music).

What is the best way at a reasonable cost ($75 maximum, preferably $20-$50) to pick up these stations better? New antenna, receiver, etc? Any recommendations for brand, store, etc? Is my price restriction too low for what I want? Is my wish beyond the capabilities of radio waves?

If you can, please e-mail any advice/input/experiences to:

bwight@ix.netcom.com

Thanks in advance,
Brian Wight

755. Re: Restoring HQ-129-X

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-16 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4dg9gb$i7q@mksrv1.dseg.ti.com>
Source record: 207174

I restored an HQ-129-X a couple of years ago. It was a fun project and very rewarding. My set was a one-owner unit with the matching speaker and original manual. It had not been run in about thirty years. I got it for free! :)

I replaced ALL of the old rolled-waxed-paper capacitors with modern mylar (?) units (the yellow ones), and also replaced the electrolytics. Nearly all of the tubes were bad, and I replaced those as well.

I disassembled the set as much as possible, cleaned every-thing thoroughly, and "fired 'er up". I was pleased when the ol' gal came to life the first try!

As for cosmetic restoration, this is a big challenge. The front panel on mine was very worn and the markings were not salvageable. I stripped the panel to bare metal, primered it, and painted it using a light gray that was extremely close to the original color. As for the lettering, I got a set of rub-on lettering from Antique Electronic Supply in Tempe, AZ. I was able to re-create ALL of the markings on the front panel controls, very very close to the original. The big "HAMMARLUND" script and the "HQ-192-X" names were not re-creatable, so I left them off (a skilled artist may be able to hand-letter these with a fine paint brush). I clear-coated the entire panel after completing the lettering process, applying about a dozen fine coats for protection.

I stripped the cabinet to bare metal, sanded away a few rust spots, primered it, then shot it with black wrinkle-finish paint. Same for the speaker cabinet.

I couldn't locate a speaker the right size, so I bought a big replacement speaker at Radio Shack and made a plywood spacer to mount it in the cabinet, and added grille cloth to cover the entire assembly before installing it in the cabinet. I used a beige grille cloth, which looked very nice contrasted against the black paint.

No, the restoration was not all original. However, the set drew plenty of attention at the hamfest where I sold it (this was in October, 1994). This past October at the same hamfest, the fellow who bought the set came up to me and told me that it was still working perfectly, and he was very proud to show it to visitors (he actually uses it on the air as a companion to an old Johnson rig!).

Would I do it again? You bet! In fact, I've located a candidate HQ-129-X, and I'm trying to talk the guy out of it (but it was his father's set, and he is not sure if he wants to let it get away, even though right now it's nothing but a piece of junk).

73 and good luck!
Dean, KC5NG

757. Opinions on the TenTec Scout?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-16 00:00:00 UTC
From: sgray@mail.microserve.net
Message-ID: <4dh6uf$lof@nuclear.microserve.net>
Source record: 207176

I read, quite a few months ago, a series of comments about the TenTec Scout. I haven't heard much in the way of commentary about the rig recently, and since I am considering purchasing one, I would appreciate any and all feedback on the rig anyone would care to pass along.

My main concerns revolve around receiver performance, and a comment someone made about the Scout's poor performance on CW.

Thanks for your help!

The production version of KaGOLD is a very excellent, user-friendly, etc. etc. etc. product. The testdrive version sucks, however. It has not been updated for years. In addition, it performs all sorts of reconfigurations on your TNC that it does not bother to undo when the 30 minutes is up. Even if you LOVE the testdrive (which I doubt, but you never know), it is unlikely that you will call Interflex up and have a working version of the software in a few minutes, so you may want to use your old software a bit more.

My advice to people who are interested in KaGOLD is to STAY AWAY from the testdrive version and go visit someone who is using the real thing to see all that it can do. The testdrive has probably lost Interflex more customers than it has gained them.

762. Sony SW1S for sale!!! (or trade?)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-16 00:00:00 UTC
From: Dave Campbell <campy@falcon.cc.ukans.edu>
Message-ID: <1996Jan16.213837.112039@kuhub.cc.ukans.edu>
Source record: 207181

I have a Sony SW1S in perfect condition with all accesories and manuals
and the neat case. I'm upgrading to a base SW rig, so I don't need this
one any more. I'm asking $200 or best offer, or a reasonable trade.
Here's the info on the radio:

Sony ICF-SW1S
-150-29995kHz AM
-76-108 MHz FM
-10 Memories
-Slightly larger than a casset tape case
-Antenna controller module
-Active antenna
-World power adaptor
-Deluxe hard carrying case for entire system
-'Turbo' headphones
-All manuals and Freq guide
-Carrying straps

This is a fine radio that has great sensitivity and is extremely
portable. You could easily take it with you wherever you go for whatever
reason necesarry. It's an easy decision to take this radio with you on
trips, because the carrying case holds everything very securely, and it's
all so small!

Hello, name is Morgan Hoaglin
I am looking for a working 440 Repeater for our local
Red Cross Chapter to put up. I have cans and a assigned frequency pair.
This is for a good cause...you see...
What we have in mind is to use "cross band rpt" capable mobiles...
like kenwood 731... in the field so we can use 2m portables on low power
and crossband rpt back to chapter into our 440 rptr with our disigned
short squelch tail for quicker tx to rx delay.
tnx...de WW7B

morganhoag@aol.com or

hoaglin@primenet.com

p.s. we can do a thank you letter from our chapter which depending
on what your tax man says, might mean a deduction.

772. recomendations for dual-band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-16 00:00:00 UTC
From: walter@physics7.berkeley.edu
Message-ID: <4depsu$q9h@agate.berkeley.edu>
Source record: 207230

I'm looking into buying two HT's for myself and my wife.
We're interested in dual band (144/440) HT's small enough
to carry around all day in a purse or backpack. We're
getting some gift certificates to help out, so will buy
new equipment. However, I've been out of the ham scene
for awhile, so I'm not up on all the latest gadgets HT's
have nowadays.

So I'm looking for any advice -- especially about companies,
which are good, which are bad. Also any comments on specific
radios people like/dislike, and what extras are really handy,
and which just add weight. Thanks for any comments!

>to drive a 435 mhz transverter with a 28 mhz rig on ssb and CW.
>I can pay for photo-copying, postage and other reasonable
>expenses. AA2LJ

You need a 33 db Tee pad. A Tee pad looks like this:

```
R1 R1
IN ----/\/\/\/\-----x-----/\/\/\/\----- OUT
|
/
\ R2
/
|
-----
---
-
```

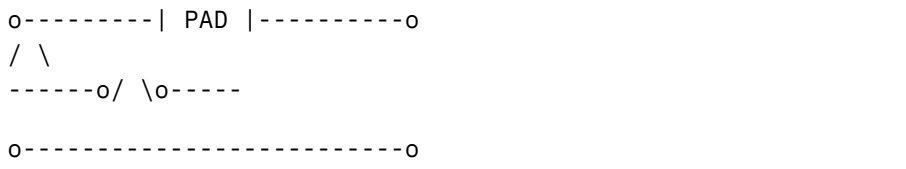
The R1 values will be approximately 47 ohms, and the R2 value
will be approximately 3 ohms. The R1 on the input side will
dissipate most of the power, so it should be rated at least
10 watts. R2 can be a 2 watt resistor, and the R1 at the output
can be a 1/2 watt unit.

All three resistors must be non-inductive. That's a problem
for the 10 watt resistor since most resistors you'll find
in that wattage will be wire wound units. That won't work,
you need carbon resistors. So you can parallel a bunch of
smaller resistors (10 470 ohm 1 watt units) to get the desired
value and wattage.

Make all lead lengths as short as you can, and put a shield
between the junction point and the output R1 to prevent leakage.
A good way to make the input R1 is to take two small pieces of
circuit board, drill 10 holes in each in a circle, sandwich
the resistors between the two boards so that they fit right
down against the resistor bodies, and solder. Leave one resistor
lead on each end sticking out to make the connections to the
input connector and to the junction point. Put the whole pad
in a small metal box with connectors on each end.

If your transverter and radio don't have split transmit and
receive ports, you'll also need a double pole double throw
switch or relay to bypass the pad during receive. It'll look

like this:



(Shown with the pad switched in) If you use a relay, you can
arrange to drive it with the external amplifier keying signal
from your transceiver. If you use a switch, don't forget to
switch the pad in before transmitting!!!

Anyone out there had any first hand, preferably long term experience with the Russian 572 finals (yeah, I KNOW they haven't been out very long, but do your best...) My first visual inspection of these left me quite dubious of their potential, but then my wife said the same thing about me, and look how well I turned out...
Anyway would appreciate feedback from anyone having first hand info.

From: S926862@cuhk.hk
Message-ID: <4df8j7$22s@hpg30a.csc.cuhk.hk>
Source record: 207237

Is the multi-bands radio receiver able to receive any radio frequency(radio program) all over the world(e.g in Asia receive UK radio program)? Provided that the receiver is sensitive enough.
Maybe it's a silly question. But I really don't know it. Anyone can help.

Martin
CUHK

p.s. please mail me personally 'cos I don't check this group often ,Thanks.

Hi,

Our radio group received a donation of a Kenwood TH-45 430 Mhz rig.
It seems to work great from 430 to 439.975. It seems to be set up for
Japan. Does anyone know of a way to make this rig work in the US range
from 440 to 449.995??? It also seems to have the wrong freq steps, it
only goes in 20 Khz steps.

Thank you for your help.

796. Choosing Amplifier ??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-16 00:00:00 UTC
From: l38217@alfa.ist.utl.pt
Message-ID: <4dgpdp$8oq@ci.ist.utl.pt>
Source record: 207254

Hello

I am planning to buy my first HF linear amplifier.
I've seen two advertisements that have cought my
atention. One is about an Heath SB-230 (uses a
8873 - 1kW PEP), the other is a Collins 30L1 (uses
four 811 - 1kW PEP).
Both satisfy me concerning output power and
dimensions (must use a desktop linear).
I wonder if anyone has already experienced both
so it can guive me an advice choosing between one
or the other.

73 + good DX

ps: I am very found of contests, so the linear must
hang on well during long time operation.

Hi everyone...I have a few questions, once again....First of all, how do
you remove the cover on a GE Master II, since there is no key lock on the one that
I have?? Do i pry it open with a screwdriver, or what??
Secondly, what is a good source of copper foil? i'm going to try to shield
the receiver with copper foil.....
And finally, on a different subject, which connector is the "Molex"
connector on the Motorola MICOR ? It is supposed to be a 9 pin
connector, but all that my MICOR has is a 20-something pin connector
under the lock bar...i need to locate this MOLEX connector...help!

I have a BC2500XLT in Excelent condition. It has never been used outside the house. All known MODs have been applied.

All original packing materials and box are present along with accessories:
Antenna, Charger, Leather Carrying case, Belt Clip, Operating guide and Registration form.

The features include:
100 channel/second Turbo Scan
VFO Control
Direct Keypad entry
400 channels
20 banks
25MHz - 1.3GHz
10 Priority channels
Auto Scan for Weather channels
Auto Store while scanning
Auto Sort
Retains programming with battery removed.

Asking $300.00 I'll pay shipping.

From: artburke@solar.sky.net
Message-ID: <4dj1h5$rjh@alpha.sky.net>
Source record: 207110

You do not have to be active military (or reserve) to participate in MARS. Several of the military branches (ARMY, USAF, etc) have their own MARS groups. The key, as stated previously in this thread, is that the CAP and MARS groups operate in frequencies outside of the amateur bands, but usually near the band edges, hence the greater likelihood of amateur equipment capability of these operating frequencies. I served in the USAF for almost ten years and never had anything to do with MARS. Several years after I was discharged I became a ham and, through some friends, got involved in Army MARS in Florida. It's interesting. I'll leave it at that!

RF: The Analog Analysis Program

by Academic Technologies

RF is a new inexpensive circuit simulation sw package for
Windows, Windows 95 and Windows NT. It is primarily
intended for Radio Frequency design but is applicable
to all frequencies.

Come and have a look, visit out Web site at:

http://www.onthenet.com.au/~academic/Welcome.htm

or download the readme.txt and rfdemo.zip demo
version from:

ftp.onthenet.com.au in /pub/acdemic/

or mail us at:

academic@onthenet.com.au

Briefly RF has the following functions:

Tools
Convert between S,Y,Z and ABCD two port parameters
Design Butterworth and Chebichev Filters
Design and analyse coil and wire inductors
Sophisticated Microstrip design and analysis
Design parallel, series resonators and LC filters
Complex/Polar calculator

Compnents
Capacitors (includes parasitics)
Resistors (includes parasitics)
Inductors (Q included)
Curve fitted S parameter devices and whole circuits (fit types:
rational, polynomial, spline, ls, linear)
OpAmps
Transmission Lines (ideal and lossy, open and shorted)
Transformers (ideal and non ideal, leakage inductances and resistances)
FETS (all parasitics)
Tapped Inductors (Q and parasitics)
Beta controlled current sources (all parasitics)
VCCS
Mutual inductors (all parasitics)
Source and Loads
DC source

Analysis Facilities
Swept frequency (Full and Nodal)
Single frequency component tolerance
Swept frequency component tolerance
DC bias point analysis
Pulse analysis (Fourier simulated)

Text Output
Transducer gain
Linvil c stability
Stern k stability
Input impedance
Output impedance
Input admittance
Output admittance
Voltage gain
S11, S12, S21, S22 S parameters
Input reflection coefficient
Output reflection coefficient
Maximum transducer gain possible
Source admittance/impedance to obtain Gtmax
Load admittance/impedance to obtain Gtmax

Graphical Output
Voltage Gain
Transducer gain
Input impedance
Output impedance
S11, S12, S21, S22 S parameters
Input reflection coefficient
Output reflection coefficient
Pulse time trace
Multiple "tagged" plots
Autoscaling or manual scale
Auto cursor tracking (warps to and displays the nearest
points) or absolute
Points or line traces

812. Re: S-Com 7K

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-17 00:00:00 UTC
From: dbwillia@uci.edu
Message-ID: <4djtmd$lbm@news.service.uci.edu>
Source record: 207120

In article <4decoo$mls@comet.connix.com>, hcbacon@connix.com says...

>I just bought an S-Com 7K controller for my repeater..
>DTMF keypad'n is giving me mushroom fingers.. is there a
>shareware/free ware program way for programing this puppy?

Don't forget, you can set up macros to program the changes that
you like to make routinely.

Also, S-com sends info on various products to use over the phone
lines. If shareware or freeware is available, I'd also like to
know.

813. IC-706 Service Manuals are HERE!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-17 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1996Jan17.202235.28050@ke4zv.atl.ga.us>
Source record: 207121

Look out, we're dangerous now! The IC-706 service manual just arrived. Now I know why the yellow wire mod works. But I also know it's the wrong way to fix the receive deafness problem above 2 meters. When the B8W signal goes active (yellow wire), the 2 meter BP filter is switched out, and *two* other filters are switched in, a high pass and a low pass. The high pass corner frequency is around 41 MHz, but the low pass corner is *not* around 200 MHz. It is much lower, around 130 MHz, so no wonder the rig is deaf as a post above 148 MHz. We need to change a couple of component values to move the LP corner up around 200 MHz and we'll have full coverage. I'm going to model the filters on the computer and we'll see what values we'll need. My first rough guess is that L40 and L49 need to have some turns removed. (I guess if you wanted to be crude you could just jumper them out.) These filters are on the PA board.

The radio uses high side injection for the LO to mix to the first IF at 69.0115 MHz. At 200 MHz, the LO is operating at 269.0115. At 149 MHz, the LO is at 218.0115 MHz. The problem comes when the LO is tuned for 61 to 143 MHz operation. At 143 MHz, the LO is at 212 MHz so that's Ok, the image is at 281 MHz. But down at 61 MHz the LO is at 130 MHz, and that isn't OK since the image will fall on 199 MHz, and that's the upper edge of VHF TV channel 11. We may want to sacrifice a bit of the upper coverage edge to give us some image protection from TV channels 11, 12, and 13 when we're tuning from 61 to 73 MHz.

The transmit power control is done by IC7 in conjunction with D/A converter IC35 pin 12, which is the POC reference from the microprocessor. IC7 drives Q39 which drives PIN diodes in the second IF to limit drive to the PAs. I suspect that'd have to be defeated to get transmit power up outside 2 meters, and that's a bad idea because the uP varies POC for VSWR foldback on HF. There is no foldback on VHF, the VHF finals are supposed to be tough enough to work with a bad load, but since power control is before both sets of finals, there's no way to split it. There are some new possibilities to explore with programming diodes, however. D57, D58, D59, D60, D72, D84, and D85 are the programming diodes. We already know what happens when we remove D59 and reset, but we don't know yet what the others do. They're labeled variously as USA only, Den only, Fra only, Eur only, etc. Somehow I expect that they're more restrictive than what we have now. Though if you're adventurous, you might play with D60 and D72 and see what they do.

Source record: 207122

I didn't follow the threads on this topic, but being an owner of a Scout
I can honestly say the CW is superb and crisp, the receiver is as good
if not better than higher priced rigs on the market and it's only draw
back I have found as been the freq. read out and it's not as pretty as
some of the rigs on the market. I got "rid" of a Yeasu 840 to purchase
the Scout since the Scout had a better receiver, built-in keyer and the
"jones" filter worked better than the Yeasu crystal filter.

Enough already! Will you two just grow up!

I don't give a flying @#%$ what your problems are with each other or with
the world for that matter.

I can't speak for everyone, but I am growing tired of you wasting the
bandwidth that others respect (not me mind you, but "others").

Take a hint from comments like: "The buffer on my server only lists back to a
few weeks... too many Cheek/Moss messages I guess !", and "maybe from having to
read too much Cheek/Moss diatribe." some of us are growing tired of your
childish banter.

When I try to read a follow up article on the Pro-26 I get verbal diaharea
(sp?) mixed in as is in the following example:

> >I need the cellular mods for The Radio Shack Pro-26 Hand Scanner if any are
> > available. Thanks.. Steve
>
Don't we all. The PRO-26 cannot be modified for cellular
reception, nor can any other scanner manufactured or imported
after April, 1994. There are a couple of roundabout exceptions,
but those require reprogramming the EEPROM. The PRO-26 is
not one of those.

Alas. 'Sniff.

818. Re: Modutec AC panel freq meter - available?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-17 00:00:00 UTC
From: Tom Pfaffenbach <tvpfaffe@mail.delcoelect.com>
Message-ID: <4dj20e$fvb@kocrsv08.delcoelect.com>
Source record: 207126
Cross-posted to: alt.engineering.electrical,sci.electronics.components,sci.electronics.equipment,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Fair Radio in Lima, Ohio, has surplus panel mount reed frequency meters. You can also use an
Automotive type tachometer, which essentially is a clipper/differentiator/rectifier/VM type of
frequency meter. 60 Hz is 1800 RPM on a 4 cylinder engine scale.
If you care to build your own, approximate circuit constants for 60Hz center scale on a 200ua
meter movement would require a 47K ohm series limiting resistor, an 8v zener diode clipper, a .3uf differentiating capacitor, a small bridge meter rectifier, and a 10K ohm calibrating rheostat to shunt the 200ua meter movement.
You can also use an ordinary synchronous motor clock by timing the second hand against your watch.

For my $75 or $100 I'd pickup a used Palomar or RadioWest directional loop antenna; as a second choice (for $30) I'd put up an outdoor antenna from Radio Shack.
Third choice requires a lot of real estate: take a 2000 foot long insulated wire, lay on the ground or 5-10 high stretched out in a straight line towarsds the stns you want to hear.
Used during WWII to pickup Topkyo stations from Hawaii, and German stations from England, the Beverage antennas (also called wave antennas)(no it has nothing to with getting drunk, though all BCB DXers imbibe a bit)(kidding!) have special characteristicsof extreme directionality. Recently a bunch of Beverage nuts went to Newfoundland, stretched out some Beverages and picked up AM stations from 100 countries, including India, South Africa, etc.
(of course you could stretch a 400 mile longwire right to the station!)

822. KENNEDY ASSASSINATION

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-17 00:00:00 UTC
From: richardc@slip.net
Message-ID: <4di329$rsl@news2.isp.net>
Source record: 207189

On November 22, 1963 Israel's Mossad collaborated with the CIA in the assassination of President John F. Kennedy because of JFK's behind-the-scenes efforts to stop Israel from building the nuclear bomb . . . Now, in an ironic turnabout, a long-time Mossad figure - Israeli Prime Minister Yitzhak Rabin - has died at the hands of an assassin . . .
The death of Rabin stems directly from the very crisis that began when - following JFK's assassination - Lyndon Johnson reversed JFK's Middle East policy and engulfed America in the treacherous quicksand of Israeli intrigue. . .
Find out the whole truth about the Mossad's role in the JFK assassination and you'll understand why American entanglement in the Middle East can only bring disaster . . .
Available at last . . . The all-new, updated, expanded, enriched third edition of Michael Collins Piper's blockbuster JFK assassination best-seller -
FINAL JUDGMENT
* An all-new index;
* Fifty additional pages (now 385 pages);
* Fully 69 additional footnotes; (grand total: 746)
* An all-new special "Who's Who in the JFK Assassination Conspiracy?";
* Fascinating new introductions by both the publisher and the author;
* An all-new appendix on Lee Harvey Oswald's little-known association with a notorious long-time BATF and FBI undercover informant.
* An all-new "postscript" revealing devastating details about the so-called "French connection" and yet another (never-before-publicized) murder of a material witness;
* Plus lots more . . .
When FINAL JUDGMENT was first released in January of 1994, it became an overnight "underground best-seller." More than 7,000 copies were sold within one week's time - a record not even many "New york Times" best-sellers can match. Yet, FINAL JUDGMENT has never once been mentioned in the major media - which is otherwise eager to capitalize on news about the Kennedy family and the JFK assassination.

The book lays forth hard evidence that Israel's Mossad collaborated alongside the CIA and the Meyer Lansky crime syndicate in the assassination of President Kennedy. And since the book was first published, NOT ONE PERSON HAS ATTEMPTED TO REFUTE ITS CONCLUSIONS.
If you're one of thousands who've already read FINAL JUDGMENT, then you'll definitely want to read this explosive new edition of the

book. If you haven't yet read FINAL JUDGMENT, then NOW IS THE TIME TO ORDER YOUR COPY OF THIS SUBSTANTIALLY ENRICHED THIRD EDITION.
To order your copy of FINAL JUDGMENT call 1-800-522-6292 and charge your order to your Visa or MasterCard, or mail $20 per copy of FINAL JUDGMENT to
LIBERTY LIBRARY
300 Independence Avenue, S.E.

>Standard HT with a different name on the case.

>73 de KB9JTT
>-Will from Wisconsin

I had an ADI 2m HT for a while... It was a Standard, inside and out.

I can't recall the model #, but the problem I had with it was
two-fold: (1) The CPU kept going belly-up, twice in three years and
(2) Getting it serviced was a nightmare.

Standard denied any connection, even though their name was on the PCB
and I could find only one place (some outfit in GA) that would work on
the rig at all, and they were SLOW.

Things may have changed now, but my own experiences with this turned
me off to both ADI and Standard. Looking at it, I would probably buy
another ADI before I bought a Standard.... I didn't care for
Standard's attitude on the phone.

Allied is carring Cardwell power resistors that are non inductive,
Cardwell claims flat to 100 Mhz, that dissapate up to 50 watts each. They
need a heat sink. They cost about $8.00 each.

I built a dummy load using 2 50 watt 100 ohm resistors in parrallel. It is
flat to 200 MHZ and has about a 1.5 to 1 SWR at 440. The reactance is in
my construction not in the resistor.

>improvemnet on the weak signal, since the audio was poor at this point
>but on a full quietting signal the dsp down graded the audio. If there
>was a way to switch the unit in and out of the circuit, it could help.

I'm currently tinkering with DSP on the UHF link of my 10 meter repeater to eliminate radar interference. The bench tests look good. I didn't notice any problems with the audio on a strong signal. I haven't crossed the tone signalling "bridge" you mentioned yet, but the "early steering output" on the tone decoder could be used to bypass the DSP during signalling.

In your application, you might look at agc levels or plop in a noise switch to look for "x" amount of quieting, and toggle the DSP with that. I found the time delay caused by the DSP nice and useful to hide the squelch tails.

On a sideline, I got one of the ANC-4's for Christmas. I drug it out to the 10 meter repeater RX site and found it to work wonders on the locally generated powerline noise. There will probably be one installed at the site in the near future...

Yes, just unplug the 4 conductor plug from your AH2 controller unit
and plug it into the back of the IC706. Itll work fine. AH2 is the same
as the AH3 (AH3 just doesnt use controller)

From: s3_0114@EFP.Poznan.PL
Message-ID: <Pine.A32.3.91.960117123327.14729A-100000@ITU1Lab.EFP.Poznan.PL>
Source record: 207201

Is it possible to expand Icom IC-T22 TX frequency range to at least 144-160MHz?

I need it to communicate with paraglider pilots in Poland who use the frequencies around 160MHz as well as with hams at 144-148MHz.

Thanks for helping me.

Tomek

Source record: 207202

>My main concerns revolve around receiver performance, and a comment
>someone made about the Scout's poor performance on CW.

The cw- performance of the Scout is actually very good.
Ten-Tec (being honest) mention that the frequency controll
loop may adjust the transmit frequency by a small increment during long
transmissions, if the rig is not in a thermal equilibrium.

843. 3-1000Z vs. 4-1000A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-18 00:00:00 UTC
From: Ken Gianino <gianino@sbctri.sbc.com>
Message-ID: <4dm7b6$poi@sbctri.tri.sbc.com>
Source record: 207060

I have a chance to buy a 3-1000Z based HF amplifier. Do the 3-1000Z
and 4-1000A share the same base (as the 3-500Z and 4-400A do)? I see
a lot of comercial "pull" 4-1000's but hear very little of the 3-1000.
Do the Chinese or Russian factories make a plug-in equivalent as they
do for the 3-500Z? This is a commercial autotune amplifier so
changing the tube socket would not be a trivial matter.

Sorry about posting this under a new thread, but the news server's just eaten the last one.

I've partly solved the problem, on further investigation last night i found that the plastic on the battery connection plate was warped so i remove the plate, it appears that the radio has become 'very' hot at some point, as the negative battery lead has become unsoldered. The problem now is, where do i resolder the lead (the negative is the grey lead) there is a "-" in a box on the pcb but do i resolder the wire to the pad to the left (which has a capacitor lead soldered to it, or the one below it ?

The other problem is, how do i open up the case, as far as i can tell there are three screws holding it together, one above the ptt, one below and one where the wrist strap goes. But when these are removed the top still seems to be fixed to some thing?

849. Re: IC-706 Service Manuals are HERE!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-18 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1996Jan18.162033.1611@ke4zv.atl.ga.us>
Source record: 207066

Ok, here's the computer simulation info I promised. I modeled
the 60 MHz to 200 MHz bandpass response. To say the least, it
sucked rocks. There are two poles, one at about 136 MHz and the
other at about 160.5 MHz. Response is nice and flat from 60 MHz
to 120 MHz with less than 4 db of ripple, but it takes a dive from
there. In the 130 MHz to 170 MHz range, the loss is at least 36 db,
rising back to only 30 db at 200 MHz. Image rejection at 280 MHz
is only 26 db.

Now the ideal fix is to change the inductors so that L49 is 27nH,
L40 is 22 nH, and change C152 to 30pF. That gives a lovely passband
across 60 MHz to 200 MHz, and gives strong image rejection at 280 MHz
and up, with one of the nulls falling right on that frequency. The
factory ought to do that.

Unfortunately, examination shows these coils aren't easy to modify.
So there's another way that still gives a pretty good response. If
you remove C53 and C153, you'll get full response, though with a dip
of 4 db in the 160 MHz to 180 MHz range, and only 26 db of image
rejection at 280 MHz. But if you increase the value of C152 to 32pF
by tacking the removed C153 across it, response flattens and tightens
in the upper VHF range, and image rejection improves to 31 db at 280 MHz.
That's about as good as we're going to get without replacing L49 and L40
and C152 with the recomended values.

Here's the ARRL Radio Designer file for the filter.

Greg KO6TH brings up a recurring problem with my DJ-580.... the danged BNC connector gets really sloppy... of course, any BNC does this but the 580 seems to be worse than others... I made mine worse by hanging a BNC-to-SO239 transition and an SO239 (UHF) connector to the car's antenna coax so I can use the 580 as a mobile... I also got a remote mic so I could lock the HT down and not flex the antenna connection

Anybody solved the problem? Yeah, with the Alinco rubber duck there is no stress on the BNC connector.... but a rubber duck ain't that hot... and I did not see any easy way to replace the BNC

I was just given this radio out of a junk pile. The battery is shot. :(

However, if I plug it into a DC power supply, I do get a 'click' when turning it on.

Upon opening it up, I see that there are three sets of crystals in the radio.

Questions:
1) Is this an old "Radio Shack" product, in that the Radio Shack people could fix it?
2) Anyone out there have a tech manual for this thing?
3) Anyone know where I could get a new battery and some freq crystals to put in?

854. ICOM IC 2350H MODS?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-18 00:00:00 UTC
From: mikecox@icon.net
Message-ID: <4dkak1$7d1@news.icon.net>
Source record: 207129

Does anyone have and have you used the mod for the ICOM 2350H. I have the sheet from Icom showing the two diodes and the wire that is affected. I also have the mod listed here on the "net".
However after opening up my 2350, the diodes on the logic board don't have matching numbers to either mod listed. Icom shows diodes D8 & D9. The mod on the net shows diodes D9 & D10. However my radio has D6 & D7 in those locations.
Any info out there ?

Thanks, Mike KI5DF

>73's,
>Dan N7VOE

A friend am mine (N9WLS) and I (N9WDH) both bought 2350H's at a hamfest last fall. I have had no intermod problem at all. WLS (what a call, eh) experiences some intermod when he passes very close to a couple of paging towers in town. Other than that we have had no problems. We don't live in a big city though, so I am not sure how well it would perform in downtown Chicago. I know that my 530 has horrible intermod in Chicago, but I haven't taken my 2350 into the city.

Altogether, I love my 2350. It scans *fast* compared to most of the mobiles out there. It's easy to use, it's compact. The DTMF buttons are too small, though. That's OK, I don't use any autopatches. I think that it is a best buy because it is the highest quality radio for the dollar. You can pick it up most places for less that $500. Try doing that with a Kenwood.

I hope this helps a little bit.

858. New All Band Mobile Antenna for IC-706 HF+6m+2m Rig-->Comet CA-HV

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-18 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9601181746.AA20334@haldir>
Source record: 207133

Has anyone tried the new Comet Antenna
CA-HV Antenna with the Comet CF-530 with
their new Icom IC-706.
A dealer in LA quoted about $170 US Dollars on the
Comet CA-HV and $130 for the Diplexer so that the one
antenna cable splits into two ports for the IC-706.
Has any tried this Antenna without or with the Icom
Automatic Tuner (AT-180).
This antenna covers 40meters, 15meters, 10meters,
6meters, and 2 meters all in one Antenna. The people
at Comet Antenna specifically made this Antenna for
the Icom IC-706 mobile radio.
Any comments are appreciated!!
Answer via internet, since there are many IC-706
owners out there that may be interested in info on
this!!

859. TEN TEC Six Meter Kits

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-18 00:00:00 UTC
From: Chester Bowles <bowles@cmf.org>
Message-ID: <4dm9bq$6ci@news.monad.net>
Source record: 207134

In the latest issue of _QST_, there's an ad for TEN TEC kits (I know they've had a kit division for some time, but I don't think I seen an ad before).

They advertised a six meter mobile FM transceiver kit. It sounded pretty nice for $195, but it was only 5 watts. They had an additional power module for the two meter version, but said FCC regulations did not permit the extra power module to be sold for the six meter version. What's that all about?

The kit's not available until 2/96. Anyone have more information about it?

Thanks,
Chet, AA1EX

The scout is a nice rig with good rx performance and a nice compact,
footprint. It is a "basic" rig and lacks alot of the features seen in
other small HF rigs. i.e. notch, rf gain, CW offset, PBT, VOX, ...

I have owned one for almost a year and i love it. I like the layout,
it is easy to operate while mobile, CW performance is outstanding (Not
an OMNI 6, but hey...), and the Jones Filter works. I have the same
complaints as most Scout users, sidetone volume and power output are
hard to access, a bit of processor whine, the Jones filter has some
attenuation of the passband at narrow settings, and the keyer
emulation/drift correction conflict = some drift.

I beat the drift by putting the rig in keyer-speed select mode and
letting the PTO settle down. Then the auto correct does not have to
work too hard.

I dig the scout for what it is.

Well, here I go again, I've been looking for this information for some time now and hopefully SOMEONE has SOMETHING.

I have a few Novatel model 8305A cellular phones that I wish to convert over to 900MHz. They are black, square, about 10" x 10" x 2".

At the very least I need a schematic, but full service information would be nice too. I understand that there was a Novatel Amateur Radio Club at one time and they did just this, converted them over to 900MHz for packet.

Any info would be appreciated and I of course will pay costs of copying and shipping if necessary.

The IC-2SRA uses the following on the Mic/SP1 connection.

Tip is receiver audio
Ring is both mic audio and PTT
Sleeve is ground.

The 2SRA, 4SRA, W2A, and the Delta 1 all use the same pin out as above.

The second connector on the 2/4SRA has as follows
Tip is receiver antenna
Ring is 5 volts at 3 ma
Sleeve is ground

On the W2A and Delta 1 A on the second connector:

Tip is subband audio
Ring is 5 volts at 3 ma
Sleeve is ground

Hope this helps

: and other linear amps. I thought the AL-811 looked like a good price to performance
: model, but am open to any comments and suggestions
: PS

Just be sure that you take the cover off and check the solder connections through out the amp before you fire it up for the first time.

I recently went on a DX-Pedition. For our trip, my group bought a brand new AL-811A. After unpacking from the carton, I popped the cover off to remove the bubble wrap surrounding the tubes and change the primary taps on the power supply.(where I was going, the power source was 230V, 50Hz.)

Rolling around inside the case were two PEM nuts that are used to hold the cover on to the amp. I wondered why there were two screws in the bottom of the box!

Next I ran the amp at home for several hourson each band into a dummy load to make sure everything worked OK.

Upon arrival on the island, we fired up the station on several bands and made a few hundred QSO's without any problems.

The next day, during the CQWW SSB contest, while on 20M, there was a loud pop and I saw an arc near the input band switch. I took the amp off the table and we continued operating barefoot to diagnose the problem.

There was no visible damage near the 20M input coil but the 40M input coil had a black residue near the base where it solders into the PCB. The problem was VERY POOR soldering of the part.

Closer inspection revealed poor soldering on most of the parts on the PCB.

As an aside, I work for a large electronics manufacturer and am VERY familiar with modern soldering processes and am quite familiar with what a good solder joint should look like. A proper wave-soldered board (yes, these were wave-soldered) should have a sufficient amount of solder flowthrough from the bottom side of the board to leave a nice smooth fillet of solder on the leg of the component on the top side.

On the MFJ PCB, there was none or very little solder flowthrough on most components. This tells me that several things are going on on the manufacturing floor at MFJ.

1) They had either and insufficient amount of pre-heat on the boards or ran the conveyor speed too high. Either way, this is

very poor process control.

2) The plated through holes in the PCB could have been
contaminated due to poor quality PCB manufacturing techniques or
improper storage/handling of the bare PCB's.

Either or both of these conditions, along with the poorly attached PEM
nuts, are the sole result of a manufacturing operation that is out of
control.

There were three other times during our one week trip that the amplifier
had to be fixed for poor soldering and/or loose parts. Fortunately, none
of the failures resulted in damaged components that put the amplifier out
of commission.

Upon our return, a call to MFJ customer service resulted in a response of
, "impossible!" !! The amp was sold, for $400.00, last weekend, after
explaining to the present owner that he might want to buy a roll of solder
at the hamfest while he was at it!

I guess that sometimes one gets what they pay for.....

In all fairness though, when the amp was working it chugged along quite
well, good enough for 7500 QSO's in four days.

>Doug, N4IJ dsnowden@ccd.harris.com
>
>--
>Doug Snowden

Hi Doug,

I have the 751A. I use 250 Hz filters in both IF's and they both help. I think the biggest improvement you will see is better shirts and less overload from close signals. You probably won't see a big difference on clear frequencies.

If I use the main low IF 250 Hz filter on a clear band, and switch in the second 250 Hz filter there is barely any improvement. If I do so when someone 40 dB over 9 is 500 Hz away, it helps a bunch.

Perhaps you should have put a more narrow filter in the last position, and the 500 Hz in the 9 MHz IF. Then you could use different combos. Me, I always use the 250...and when it gets real tough a MFJ DSP with 50 Hz BW!

73 Tom .

>73's KB8YVN

A boat anchor is a radio that doesn't work, burned up, non fixable,
basket case, (dirty junk that weighs too much to take to the hamfest
to sell for parts). Obviously your HW-101 works, and so does my HW-100,
Heath DX-60, Drake 2NT (YES IT'S A REAL CW RIG!!,An antique curiosity nowadays!)
The tube rigs sound great and are easy to work on, and you dont need a twenty
thousand dollar spectrum analyzer to tune 'em up! We must respect the Hallicrafters,
Nationals, Johnsons and Drakes as they pioneered ham radio as we know it today.
Oh yes...anybody ever heard of a Collins KWM-2? Or anybody ever heard one on the
air? What a big, loud fat signal!! I like the new technology just fine...packets a lot
of fun, but anybody who hasn't played with a genuine warm classic tube rig is
missing a great experience, as well as being educational.

Take care of the HW-101!!

From: swithrow@nyx.cs.du.edu
Message-ID: <4dq1rp$f6o@nyx.cs.du.edu>
Source record: 207011

I am trying to reconstruct a HENRY 2K amplifier (the old original one that has the case like Collins equipment) and would like to replace the HV filter capacitor with something that is close to the original (which has been replaced already in very poor fashion). Is there a source fro these beasts out there? I don't even have a schematic, so don't know the exact value (suspect 16uF at 8000v). The physical size is about 3 3/8" by 7 3/4" by 10"(max) tall with the insulator spacing at 3 7/8". Any help out there?

73,

888. Yaesu NC-50 charger troubles

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: paulc@fc.hp.com
Message-ID: <4doo40$eqk@fcnews.fc.hp.com>
Source record: 207013

Has anyone out there experienced any troubles charging 12V batteries with the Yaesu NC-50 quick charger?

Here's my situation:

I have a Periphex 12V 800 maH FNB-whatever battery for an FT-530. The battery appears to be fine -- a load test at 100 ma gave me about 8.5 hours of use. The NC 50 wants to put about 800 ma into the battery. When I take a bench power supply and hook it up to the battery through the mini-plug jack, I can get 800 ma charging current at about 14.8V or so (it goes up, obviously, as the battery charges up). All as expected...

My problem:

The NC-50 doesn't want to charge this battery. After plugging it in, the charge light goes on for about 2.5 minutes, then starts flashing. Hooking the NC-50 to the battery directly doesn't change anything. Hooking it through the mini-plug port also makes no difference.

Putting a meter on it indicates that it gives the battery an initial jolt, then waits for a couple of minutes, then ramps the voltage up to about 15 or so, getting the 800 ma to flow. But, it shuts down after about a half-second.

Thanks anyone for any ideas. A Yaesu support person asked me to send the charger in with the battery, which I will probably end up doing...

Thanks,
-Paul C. KG0CZ Fort Collins CO

What about this overloading of the IF's due to the inability to narrow the passband to less than 3KHz? Seems like one of those things that seldom causes a problem, but hate to have the limitation.

Hello,
I have a 580 also and twice now my antenna connector had to be worked on.
The first time was just from use. The second time because I dropped the
unit. The way to fix it is to open up the radio and re-solder it back
together. You may need to push the connector up a bit before doing the
soldering. This makes it tight against the case again. Generally when the
connector gets lose, the output of radio drops off.

898. FT-51 computer interface

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: Yves Oesch <oesch@desun1.epfl.ch>
Message-ID: <4do14m$1sa@info.epfl.ch>
Source record: 207023

Hello,
I heard that it was possible to interface my dual-band handheld
transceiver (an FT 51-R from Yaesu), with my PC.
I would like to know:

- if a programm doing this job is existing
- if Yes, is it free or shareware
- if not shareware, where can i find it?
- In case i can find it, how must I physically connect the TX to the PC
(which pin of the serial port is connected to which coooector(jack) on
the radio)

That's make a lot of questions in a time. If someone knows anything
about one of this subjects, I would be very happy to receive a short
E-Mail from him (her).

Thanks a lot and best 73

>My main concerns revolve around receiver performance, and a comment
>someone made about the Scout's poor performance on CW.

Steve:

(background: owned a Scout, loved it, done mobile CW, used many TEN-TECs)

The receiver is less sensitive (by 20 microvolts or so) than many
higher performance radios, but to me this was barely perceptible to me
in practice. I noticed no problems with the CW performance on
transmit or receive, though I heard rumors of VFO drift on transmit
(in fact, this is even warned about in the manual), but I never
experienced this problem (according to those I QSO'd with). The
variable bandwidth "Jones" filter is certainly adequate for most
situations, but I found its performance not as good as crystal filters
on other TEN-TECs I have used.

In short, it's a terrific CW radio for the money, and it performs well
enough to be my only base station (or it did until I replaced it with
a higher performance TEN-TEC, but I pay the price). The combination
of built-in goodies and simplicity gives you alot of bang for the
buck. There are definately better performance radios, however.

I am upgrading my old 386dx40 system to a Pentium system. In the
process
I have many usefull parts to try to peddle. The items are listed below
and priced to go fast. They will be sold first come first serve.
Get back to me fast or make offer if only kinda interested.

1 meg 32 pin simms $20 each Have 4

IO card providing 2 com ports $3

80mb scsi hard drive as is $7 1 meg segment on hd is bad, but I
just partitioned it off and use the other 79 no problem.

Samsung data monitor, color cga with vga adaptor plug $15

XT computer only no monitor or keyboard all else there.$18 or make
offer!!!!!!

SCSI controller cable. 3 feet or so long. $3 ($5 to $15 new)

brand new dual floppy drive. 5 1/4 and 3 1/2. Fits in 5 1/4 size bay
Just one floppy sells for$45new. This went $120 new asking $55

2 working printers. Both have manuals and work fine.
Toshiba Expresswriter 420
Star SG 15

I will sell them for $40 each or both for $70

Also have

D104 microphone $30
40ch Pierce Simpson cb mobile set $15
several 23 channel cb mobile sets $7

>What would be a good 2 meter converter?
>
> Tony,

I would recommend going with the Down East Microwave transverters.
The design is very solid and easy to build up from the kit if you would want to do that. They also sell the units already assembled. For information from them look for their advertisements in the Amateur radio magazines. They do not advertise in every issue.

>Also will eventually need a 432 mhz up link transverter and amp.

Here again it would likely be a good thing to use a Down East converter. This converter that they make has 25 to 30 watts output and it may be possible that an amplifier would not be needed for the uplink.

Chet,

Don't know why there is a restriction. The IC-706 puts out 100w on 6m and the DX-70T puts out 10w on 6m. Perhaps a call to Ten-Tec in the morning will clear that up. I'm also thinking seriously about getting this kit in May. By the way I live over in Merrimack so perhaps I'll meet you on 6m someday!

909. Re: DSP on a VHF repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: "John F. Samuels" <74752.3375@CompuServe.COM>
Message-ID: <4dn8pn$f3e$1@mhadf.production.compuserve.com>
Source record: 207080

re DSP units in FM repeaters: I built and installed a W9GR
"Quantics" unit on the Rockland Repeater Association's main
repeater on 147.165 in Nyack, New York about two years ago.
Rather than leaving it in the circuit all the time (see note
about it degrading full quieting audio) I installed a DPDT relay
in place of the on-off switch and placed the relay under
touch-tone control by members. Now on weak signals the DSP does
wonders, as long as there is sufficient audio. I guess there is
a one "Q" unit difference - a Q3 signal becomes Q4, etc. After 5
minutes of repeater inactivity the DSP unit goes back off-line.

>Isn't the "on-air light flashing" the radio's way to tell you that the SWR is
> too high?

No, the on-air light means that the PLL can't lock.. Such as when there is
a problem with the PLL, or the radio is really far out of band. Same as the
receive PLL when the second dot flashes for a few seconds when you RX out
of band until it locks onto frequency.

> I seem to remember that (but of course the manual isn't near by).
>If so, this could be the "broken center pin on the BNC connector" problem. An
>easy check is to wiggle the antenna as you receive a moderate signal, and see
>if it cuts in and out.

This could be the case for the unlocking problem, however I believe that it
was mentioned that one band will RX and the other TX, but not both. This
leads me to believe something fairly drastic has happened to the radio.

>Fixing the bloody thing isn't that hard, as long as you have steady hands,
>good eyes, and a very small soldering iron. If you want a blow-by-blow
>walk through, let me know. I think I've still got the write up I did after
>my first experience with this problem.

If this doesn't work, send it to Alinco.. If you're lucky their repair bill
plus $100 won't buy you a new one like the bill they're trying to charge ME
with.

>Good luck,

Same here..

913. FS: KPC-2 Packet Controller

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: "Robert J. Hall" <rjhall@mtu.edu>
Message-ID: <Pine.SUN.3.91.960119012307.23835A-100000@techsrv1.tech.mtu.edu>
Source record: 207084

Hello .. I have decided to sell my KPC-2 Packet radio TNC and
Regency BTH-201B 25 Watt VHF Tranceiver crystalled to 145.01 MHZ.

I am asking $100 for the KPC-2 ALONE.
The KPC-2 With the REGENCY BTH-201B radio I am asking $170.
I will also be asking $5 for Shipping.

The Regency base station is all ready to go and is Currently wired and
working well with the KPC-2. The base station has it's own built in
Power supply. Regency BTH-201B 25 Watt VHF Tranceiver crystalled to
145.01 MHZ.

I am not interested in selling the radio seperate from the TNC, but would
be interested in selling the TNC alone. If I don't sell them I'll
continue to use them, and If I don't sell the radio with it, I'll crystal
it for voice and use it there.

The KPC-2 has version 2.85 firmware and has PBBS, NODE, and DIGI
functions. It's run well for the last 4 years without ever having a
problem. It originally cost $170. I orginally purchased the Regency
about 2 years ago from a friend for $60 and recrystaled and tuned it for
another $30 from Jan Crystals. It works well and also has never given me
any problems.

I don't normally have time to monitor the news groups so any response to
this should be via e-mail or phone listed below.

914. Re: TEN TEC Six Meter Kits

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: Chester Bowles <bowles@cmf.org>
Message-ID: <4do3g0$8hd@news.monad.net>
Source record: 207085

Dave Feldman, WB0GAZ, wrote to suggest that it may have something to do with the restriction against 25-60 MHz amplifiers--in other words, the CB ban, which is why there are no amplifiers for 10 Meters. He's probably right, but it's too bad. Five watts mobile on 6 Meters just can't be enough to be effective, particularly given the small number of 6 Meter repeaters.

915. Re: New Vocal Eliminator Algorithm

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: "Lacy Thompson Jr." <ltsound@atl.mindspring.com>
Message-ID: <4do8bf$7n7@brickbat.mindspring.com>
Source record: 207086

A new Vocal Eliminator algorithm which allows for even more vocal elimination than LT Sound's State of the Art VE3+ will be introduced in early 1996. Persons interested in finding out more about the Thompson Vocal Eliminator(tm) are invited to visit our home page at http://www.mindspring.com/~ltsound/lthome.htm or e-mail a catalog request to ltsound@mindspring.com
The VE3+ contains State of the Art Vocal Elimination, Key Transposition, and Vocal Enhancement in one compact unit. The Thompson Vocal Eliminator(tm) allows users to remove the vocal from standard stereo recordings producing inexpensive, instantly available background music from the original standard recording. Software upgrades occur approximately every 6 months. Current owners of the VE3+ will be able to upgrade their software for a nominal charge of $25.

916. Ten-Tec & 6-meter amps

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: an142028@anon.penet.fi
Message-ID: <163310Z19011996@anon.penet.fi>
Source record: 207087

>From: Chester Bowles <bowles@cmf.org>
>Newsgroups: rec.radio.amateur.equipment
>Subject: TEN TEC Six Meter Kits

>but said FCC regulations did not permit
>the extra power module to be sold for the six meter version. What's that
>all about?

I happened to be talking to them (Ten-Tec) on the 'phone,
and asked about 6-meter amps, and the response was that any
transistor which would work well at 50 MHz would work *GREAT* at
11 meters. The fear is that someone could change the component
values in the tuned circuit (probably by just padding the
capacitance) and presto! - instant 11-meter mobile "brick."

According to what I was *TOLD*, manufacturers of legitimate
solid-state HF amplifiers use devices which die above 25 MHz to
prevent a "hacker" from using them on 11 meters, but since a 50 MHz
"brick" wouldn't be that far away in frequency and would no doubt
have a device which works well at 27 MHz, the risk is high. A
2-meter brick, though, is far enough away in frequency that more
extensive mods would be necessary to make it work at the lower
frequency, so the risk is lower.

The only problem I have with this line of reasoning is that
Mirage sells a 160-watt 6-meter brick.....

FWIW.....

917. Re: Opinions on the TenTec Scout?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: nfourlq@sellington.win.net
Message-ID: <36@sellington.win.net>
Source record: 207088

Here are some FACTS I have gathered about the Scout from actual on
the air experience.

1. There is no band switch. A plug-in module for each band must be
pruchased. If all 9 are purchased, the cost of the Scout is close
to that of a low end import rig.

2. I have had QSO's with three cw stations who have returned their
Scouts for a refund because of poor receiver performance.

3. When used mobile, they are very voltage sensitive. On cw their
frequency constantly changes as engine speed changes.

4. Using fast cw, the frequency will change slowly, up and down
about 50hz.

5. I visited Ten-Tec's factory and asked the engineer about the
frequency drift problem. He acknowledged the problem but offered
no solution.

6. It is very simple to operate and has good QSK.

7. It is not the smallest rig available. The IC-706 is smaller.

8. Receive current drain is not all that low and would not make a
good choice for portable battery powered rig.

9. The controls feed cheap compared to the import rigs.

10 Ten-Tec is a wonderful company to do business with. I highly
recommend them.

11. Power output is 50 watts vs. 100 for the imports.

12. 50 watts is only 3db down from 100.

I don't believe the gain numbers either, but I really like the
Comet dual band antennas. To show how much I like them, I retired
my Larsen dualbander in favor of the Comet. For many years, Larsen
has been the standard by which all other mobile antennas are judged,
and it may still hold a slight performance edge, but the Comet
mechanics and esthetics are superior in my opinion.

writes:
>Am curious to hear some advice from some of you experienced folks who
>know who has the best one to buy. Or maybe suggestions on whether or
>not I should build it myself.

You can fairly easily build one yourself, Mark, but tuning it for
best noise figure might be difficult unless you have the right
equipment, or know someone who does. I like the SSB Electronics
preamps, but the Advanced Receiver Research and Landwehr units work
well too. I've used all three.

Manual TR switching via a sequencer is better than RF sense switching
for ultimate performance, but if you are running modest Tx power, RF
sense switching will suffice. It does leave the preamp vulnerable to
lightning, however. You really want the preamp out of the line when
you aren't listening. That way, when you shut down, the preamp isn't
exposed to lightning induced transients. No one is going to climb their
tower to disconnect the preamp in a storm, so having it disconnect itself
when power is removed is a plus. With the ARR preamps, it is a *necessity*,
since they have little (none really) built in transient protection.

The noise reduction mode is worthless, but the auto-notcher and the
various selectivity functions work as expected. At the sale price,
it's worthwhile, but if you want noise reduction, you're going to have
to buy one of the better units.

925. Help - Replacing Lithium battery!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-19 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4do8mq$799@cville-srv.wam.umd.edu>
Source record: 207096

I have a Yaesu FT-2400H 2m mobile; the lithium battery is dead.

This is not a problem - if you take the front of the radio off,
it's very easily accessible.

HOWEVER, the item is surface-mounted AND (this is the kicker)
straddles an IC. Indeed, I believe it to be DOUBLE-SIDED
TAPED to the IC.

Has anyone ever replaced this particular or similarly-installed
battery? What would you do to avoid damage, short of sending it
back to Yaesu?

Thanks!

Date: 1996-01-19 00:00:00 UTC
From: n9mxt1@aol.com
Message-ID: <4do9ac$hhq@newsbf02.news.aol.com>
Source record: 207097

Hello,
I am selling a PRO-2035 base scanner....

It covers 25MHz - 520MHz & 760MHz - 823.995 & 849.995 - 1300MHz

Almost brand new and still in warrenty!! Have manuels and all.....except the box.

In Radio Shack a enw Pro-2035 is going for $499. I am Selling it for $300 + shipping!

I work via COD... or I get the check first and wait 10 days! So, if that is a problem sorry!!!

f interested leave me email here.... thanks!

One of the DSP manufacturers, TIME WAVE (I think), has been advertising
a new DSP which includes modes for wider band audio; that is FM and AM.
This probably fixes the problem with losing repeater audio quality for
full quieting signals but stills takes out sizzle from lower level
signals

Hi, Paul. I wonder if the Mirage amp has
frequency-sensitive tuned circuits on the
input and output that are difficult to
re-engineer? They must have done something
significant to convince the FCC to give
them Type Acceptance on their amp...

Hmmm....
73,
Dean KC5NG

930. Re: New All Band Mobile Antenna for IC-706 HF+6m+2m Rig-->Comet CA-HV

Newsgroup: rec.radio.amateur.equipment

Source record: 207101

This antenna is mighty short for an HF antenna. Should be just better
than a dummy load. If it is all the height you can spare it is better
than nothing.

Good Luck

FS: Kantronics KPC 9612 with box and all papers.
Soldered capacitor to DIN-9 connector with 3.5 millimeter
for mic jack and 2.5 mm for speacker jack on Kenwood
handheld no cover. Also soldered power lug to 9-volt
battery snap. Will ship whole deal or unsolder the
parts for you. Works perfectly. Used only about 1 week.

$180 (includes shipping in continental US)
Will not entertain offers from outside continental US

Erickson GE Monogram Commercial 40 Watt FM Mobile For Sale.
Very Rugged up to 16 channel EPROM progamable.
Frequency Range 136 Mhz - 174 Mhz
All options Duplex, tones, scan, etc.
Currently has 16 Marine channels programmed:
6,8,9,11,12,15,16,18,20,22A,68,69,70,72,79,80A.
Perfect for small business in need of a high quality mobile to communicate
with base or for pleasure boater who requires these already programmed
frequencies.

Asking $300 cdn (current US Exchange is aprox 36% in your favour)

open to offers of trade for Amateur equipment, like 2M mobile, 6m Mobile,
HF mobile, etc.

==========

Major "Real-World" Bugging Frequencies

Common Wireless Bugs (Low Power - Well under 35-50 mw)

44.500 - 51.000 mhz "Baby/Room" monitors
72.100 - 75.400 mhz Hearing Assistance systems
54.000 - 150.000 mhz "Kit" Bugs

98.000 - 108.000 mhz Cheap out-of-band FM Bugs
112.000 - 142.000 mhz Cheap out-of-band FM Bugs
140.000 - 160.000 mhz Cheap out-of-band FM Bugs

60.000 - 320.000 mhz Low Cost kit bugs
398.000 - 406.000 mhz DECO Bugs (398.600/605, 399.450/455, 399.025/030, 406mhz)
25.000 - 450.000 mhz European/English Kit Bugs

150.000 - 216.000 mhz Typical VHF "Body Wire" & Pro-Grade Bugs
109.000 - 140.000 mhz Digital VHF Pro-Grade Bugs
138.000 - 174.000 mhz Typical "Spy Shop" & LE Cheap VHF Bugs (155-172 Popular)
140.000 - 150.000 mhz Popular Xandi Flea power kits (143/144mhz)
150.000 - 170.000 mhz Popular Japanese Flea power kits (under 5mw)

150.000 - 220.000 mhz Commercial Wireless Microphones
169.000 - 172.000 mhz 47 CFR 90.265 Authorization *** VERY Popular ***
174.000 - 216.000 mhz 47 CFR 2.106 (NG115) Authorization
395.000 - 410.000 mhz German UHF Wireless Microphones (PK Electronics)
219.000 - 530.000 mhz English UHF Wireless Microphones (300-500 popular)
470.000 - 608.000 mhz Commercial Wireless Microphones
730.000 - 806.000 mhz Commercial Wireless Microphones

889.000 - 960.000 mhz Modified Cordless Phones (S/S & Hoppers)

380.000 - 480.000 mhz Video Bugs - US
890.000 - 960.000 mhz Video Bugs - US (902-928 Hot)
905.000 - 928.000 mhz Video/Audio Consumer Products (i.e.: Recoton)

1.700 - 1.930 ghz Video Bugs - US
2.400 - 2.500 ghz Video Bugs - US *** VERY Popular ***
5.725 - 5.850 ghz Video Bugs - US *** VERY Popular ***

1.100 - 1.400 ghz PAL Video Bugs *Very Hot in
England/France/etc*
2.400 - 2.500 ghz PAL Video Bugs *Very Hot in
England/France/etc*
3.500 - 4.500 ghz PAL Video Bugs *Very Hot in
England/France/etc*

430 - 550 mhz Popular French Video/Audio Bugging System
950 - 2500 mhz Popular French Video/Audio Bugging System
700 - 900 mhz Popular Italian Audio Bugging System

"Tactical" Bugs

225 - 400 mhz "Throw away" bugs (10uw-300mw Beer can bugs)
290 - 330 mhz Micro-powered Bugs (5uw-10mw Cigarette Butt Bugs)

30 - 500 mhz Tactical Repeaters (75mw-300mw)
285 - 400 mhz Tactical Repeaters (50mw-10watts)
100 - 152 mhz VHF Tactical Repeaters (300mw-25watts)
135 - 174 mhz VHF Tactical Repeaters (300mw-25watts)

VLF and Carrier Current Type Bugs

9khz - 490 khz Carrier Current 47 CFR 15.219 Auth (250 microvolts)
490khz - 1.705 mhz Lossy Cable 47 CFR 15.221 Auth (1000 microvolts)
450khz - 30.00 mhz PLA Systems 47 CFR 15.207 Auth (30 mv@ft/30ft)

3 - 200 khz 300 mw High Grade Pro Bugs (over 500$ each)
100 - 200 khz 50-100 mw Older Bugs
120 - 200 khz 30-50 mw Pre 1990 intercoms
200 - 300 khz 30-50 mw Post 1990 intercoms
300 - 400 khz 250-400 mw TELCO Line transmitters (355khz popular)

300hz - 30 khz Cable TV Carrier - Hardwired microphones
30khz -300 khz Cable TV Carrier - Coaxial Bugs

100 - 450 khz Threat Window #1 Most CC Bugs
3khz - 3 mhz Threat Window #2 Expensive "Pro-Grade" Bugs
5khz - 32 mhz Threat Window #3 Popular WJ Carrier Current Rcvr
3khz - 50 mhz Threat Window #4 Realistic Threat Window for Telephone Wire
15mhz - 70 mhz Threat Window #5 Audio/Video "Micro-Wire" RF circuits

WECO Bugs "boosted/ultrasonic audio" found on Power/CATV/Telco lines

64kbps to 1.5mbps Digital Bugs T-Carrier-Lo (T-1 and Below)
1.5mbps to 50mbps Digital Bugs T-Carrier-Hi (T-1 and above)

2.048mbps Digital Bugs Definity Circuit Pack Bug
32mbps Digital Bugs TMS Channel/Backplane bridge
Designed to transmit on CC or Microwave ISM Spread Spectrum (2.4-6.0ghz)

VLF Devices

25khz - 90khz Tape Recorder Bias Osc-Low End (35-45khz Common)
80khz - 145khz Tape Recorder Bias Osc-Mid Range (88.2, 96, 100khz Common)
100khz - 325khz Tape Recorder Bias Osc-Pro Grade (100, 150, 300khz Common)
40khz - 50khz Tape Recorder DAT/Hi8 (44.1/48khz Common)

8khz - 35khz Recorder Audio Servo Noise (10-20khz Common)

7khz - 35khz Video Camera VLF Detectable emmisions
15.750 mhz Common NTSC Video Camera
15.734 mhz CCD/PCB Video Camera (very easy to detect)
15.625 mhz Common Video Camera

Also, be aware of ultrasonic/audio emmisions from most VLF devices.
(Utilize a EOD/Bomb Tech Stethoscope, and Ultrasonic Spectrum Analyser)

Spread Spectrum/Hopping Bugging Frequencies

Legit Industrial Equipment (very inexpensive)
902 mhz - 928 mhz ISM band A (Very Popular)
2400 mhz - 2484 mhz ISM band B (Very Popular)
5725 mhz - 5850 mhz ISM band C
10500 mhz - 10550 mhz ISM band D
24075 mhz - 24250 mhz ISM band E

SS Amateur Radio Bands Often used for eavesdropping (very inexpensive)
50 mhz - 54 mhz 6.00m Amateur Radio Equipment (STA)
144 mhz - 148 mhz 2.00m Amateur Radio Equipment (STA)
222 mhz - 225 mhz 1.25m Amateur Radio Equipment (STA)
420 mhz - 450 mhz 70cm Amateur Radio Equipment (47 USC 97.305)
902 mhz - 928 mhz 33cm Amateur Radio Equipment (47 USC 97.305)
1240 mhz - 1300 mhz 23cm Amateur Radio Equipment (47 USC 97.305)
2300 mhz - 2450 mhz 13cm Amateur Radio Equipment (47 USC 97.305)
3300 mhz - 3500 mhz 9cm Amateur Radio Equipment (47 USC 97.305)
5650 mhz - 5925 mhz 5cm Amateur Radio Equipment (47 USC 97.305)

SS Amateur Radio Bands Occasionally used for eavesdropping
10.00 ghz - 10.50 ghz 3.0cm Amateur Radio Equipment (47 USC 97.305)
24.00 ghz - 24.25 ghz 1.2cm Amateur Radio Equipment (47 USC 97.305)
47.00 ghz - 47.20 ghz 6.0mm Amateur Radio Equipment (47 USC 97.305)

SS Amateur Radio Bands Rarely used for eavesdropping (very expensive)
75.50 ghz - 81.00 ghz 4.0mm Amateur Radio Equipment (47 USC 97.305)
119.98 ghz - 120.02 ghz 2.5mm Amateur Radio Equipment (47 USC 97.305)
142.00 ghz - 149.00 ghz 2.0mm Amateur Radio Equipment (47 USC 97.305)
241.00 ghz - 250.00 ghz 1.0mm Amateur Radio Equipment (47 USC 97.305)
300.00 ghz - Light (3 Thz) Amateur Radio Equipment (47 USC 97.305)

Note: Most commmon spread spectrum/hopping bugging equipment will
hop at speeds
between 100 and 50,000 hops per second. Equipment is readily
available that
hops even faster (100,000 to 300,000 hops per second). Dwell times
can be as small as 1us (one widely used military system uses a dwell
time of 3-5us)

Outband Equipment
ANY Television broadcast or Cable TV frequency
ANY FM radio broadcast frequency
ANY Paging or Beeper frequency
ANY Cellular Telephone frequency

820 mhz - 960 mhz Modified (902-928) Cordless Telephones
Modified Amateur Radio Equipment (can be on ANY frequency)

Keep in mind that wideband (non-ISM) Spread Spectrum/Hopping Bugs
are very
difficult to detect(even if you are within a few feet). Watch for carrier
feed-through, and "Noise Floor Humps".

All Spread Spectrum devices are detectable

Once Spread Spectrum/Hopping Bugs have been located (on the RF
spectrum) all
that can be done is to locate the sourse of the emission... it is
virtually
impossible to demodulate a SS signal unless you have access to the key.

Also, a 500mw ISM device can easily have an effective range of over
20 miles.

Look for spectral anomalies (humps) on the Spectrum Analyzer, and
back up
with a Compressive receiver.

Commonly Used Law Enforcement Bugging Frequencies

37.000 - 952 mhz FCC Surveillance Blanket Authorization

47 CFR 90.19 "Physical surveillance, stakeouts, raids..."
Straight AM/FM, FM-Subcarrier, SSB, Spread Spectrum, and Hoppers.
If encrypted, it usually uses in-band voice inversion or DES.
(Normally well under 2 watts... most under 35-150mw)

148 - 174 mhz
135 - 250 mhz Out-band Wireless Microphone
174 - 216 mhz In-band Wireless Microphone
350 - 440 mhz Common Video Freqs
380 - 930 mhz Wide Band Hoppers
806 - 824 mhz
851 - 869 mhz
905 - 930 mhz Popular Audio/Video Band

1.4 - 1.5 ghz Common Video Freqs
1.7 - 1.9 ghz Common Video Freqs (1.710 - 1.755 REAL Popular at
1/10 watt)
2.4 - 2.5 ghz Common Video Freqs (2.400 - 2.450 REAL Popular)
5.7 - 5.9 ghz Common Video Freqs (5.725 - 5.850 REAL Popular)
8.5 - 10.8 ghz Common Video Freqs

173.075 - LOJACK Auto tracking system beacon (200ms burst every second)

Police Speed Enforcement Radar
10.450 - 10.600 ghz X-Band
11.488 - 11.628 ghz RD Detector
22.976 - 23.256 ghz RD Detector-2nd Harmonic
24.050 - 24.250 ghz X-Band
33.400 - 36.000 ghz Ka-Band
700nm - 1100nm Laser Threat

Electronic Article Suveillance/Anti-Shoplifting Systems
8.10mhz - 9.30mhz Checkpoint (Hi-Q Tags) 8.2mhz Common
57.75khz - 58.75khz Sensormatic (Magnetic) Books, CDs, and Tapes
915mhz and 1830mhz Knogo (Microwave Resonant) Adhesive Labels

25 - 50 mhz "Bumper Beepers" (38 - 47 mhz very popular)
135 - 170 mhz "Bumper Beepers" (150-170 mhz very popular)
450 - 512 mhz "Bumper Beepers"
903 - 904 mhz "Bumper Beepers"
904 - 912 mhz "Bumper Beepers"
918 - 926 mhz "Bumper Beepers"
926 - 927 mhz "Bumper Beepers"

WARNING:
The area between 900 mhz and 6 ghz is EXTREMELY DANGEROUS as
the eavesdropping equipment in that range is inexpensive, low power,
and highly directional.

Additionally, most TSCM people will not check frequencies above
1.0/1.5 ghz or
3 ghz (because the equipment is too expensive for them to buy).

I have seen surveillance video tapes of TSCM inspections where the video
cameras (Watec), microphones (Sony), and microwave RF transmitters (AID -
2.4ghz) were never detected by the inspectors (using 1ghz AVCOM Spectrum
Analyzers).

Surveillance Satellite (TK-Keyhole) Frequencies
Note: Mostly Wideband Spread Spectrum/LPI channels

420mhz - 450mhz
1.2ghz - 1.4ghz
1.7ghz - 1.9ghz (1.76-1.84 real active)
1.9ghz - 2.2ghz (2.115 real active)
4.9ghz - 5.0ghz
7.5ghz - 8.3ghz
10.6ghz - 12.6ghz (11.7-12.2 active)

23.6ghz - 24.0ghz
25.5ghz - 25.7ghz
22.8ghz - 33.5ghz
42.5ghz - 47.0ghz
50.3ghz - 52.4ghz
78.0ghz - 85.5ghz
86.3ghz - 98.3ghz (86-92 real active)

Commonly Used by Federal Agencies for Bugs, Wireless Microphones,
and Body Wires (also 138-220 mhz, and 399-420 mhz, under 25-50 mw).

408.5750 Federal Shared

409.4000 Federal Shared

960-1215mhz Spread Spectrum Systems (Wideband)

Generally Recognized Federal Bug/Spy Bands
Primary - 25-50mhz, 135-175mhz, 225-440mhz, 1710-1950mhz, 8.3-12.5ghz
Secondary - 890mhz-5.50ghz, 7.0-9.5ghz, 10-39.6ghz

Also, Wide Band Frequency Hopping centered on various UHF-TV channels
(ie: 510 or 670 mhz with a hopping width of +/- 25 mhz)

Keep in mind that the federal government can use virtually any
frequency between DC and light.

Band Width Resolution and Filters

Examine the spectrum with the following BW resolutions/filters:

Utilize all BW resolutions/filters between 5hz - 200mhz (depending
on band being checked)

Note: A programmable digital spectrum analyzer should be used!
(1/3/5/10/15/20/25/30/50/75/100/150/200... Sequence is prefered)

BW Res - Usage/Primary Function
100/200 mhz - Resonate Cavity Bugging Devices/SIGINT Devices
125/35/8mhz - Resonate Cavity Bugging Devices/SIGINT Devices

50/20/10mhz - Diplomatic/Intelligence Microwave Bugs
40/20/10mhz - Diplomatic/Intelligence Microwave Bugs

1mhz - 15 mhz - Realistic Subcarrier Threat (Video)

Summary (this will catch 99.99% of all Non-Intell/Diplomatic RF bugs)

All TSCM Inspections should include the following frequencies:
(Expect to see less than 10-35 mw maximum at the TX antenna)
(Do not expect the signal to be present for more than 20uS-100uS)

To find RF transmitters a search grid of 15 foot by 15 foot (or
less) should be used.

Also, all phone rooms, riser closets, demarcs, boots, etc. MUST be
checked.

Remember that the microphone/camera can be hundreds of feet away
from the transmitter.

Use a digital spectrum analyzer and a wideband receiver with an analog
10.7/21.4mhz SDU on the IF, dispersions of 100/200/500khz).

RF Spectrum Analysis and monitoring should take place for at least
twelve
solid hours during a regular sweep (72 hours or more is preferred).

To prepare for IPM the spectrum should be evaluated/monitored for at
least four hours prior to the event.

Most non-gvt RF bugs will have a transmit frequency between 9khz
and 6ghz.

The Spectrum Analyzer inspection must cover at least 3khz to 40 ghz

VLF Detection-Audio .3 khz to 100 khz Video Cameras & Tape recorders
VLF Detection-RF 12 khz to 500 khz Video Cameras & Tape recorders
VLF Detection-Audio .3 khz to 150 khz Microphone/Ultrasonic
Chirping

Carrier Current Bugs 3 khz to 50 mhz 99% Voice

RF Bugs-HF 3 khz to 50 mhz 99% Voice
Space RF Bugs-VHF 30 mhz to 300 mhz 10% Video/80% Voice/10% Data
Space RF Bugs-UHF 300 mhz to 900 mhz 25% Video/60% Voice/15% Data

RF Bugs-Microwave1 900 mhz to 3.0 ghz 70% Video/20% Voice/10% Data
RF Bugs-Microwave2 3 ghz to 18.5 ghz 75% Video/15% Voice/10% Data
RF Bugs-Microwave3 18.5 ghz to 40.0 ghz 75% Video/ 5% Voice/20% Data

...and of Course Infrared! (Look for "IR Blooms")

700 - 1100nm Audio Transmitters/Lasers (CF between 880 and 950nm)
750 - 900nm Night Vision Illuminators
900 - 1710nm IR Video Illuminators

Note:
Most military/intelligence and governmental TSCM inspections look
for devices
between 3khz to 50mhz for Carrier Current, 20khz to 40ghz for
regular free
space RF radio devices, and directional microwave devices from
.5ghz to 120ghz.

934. Want short screws for FT-23R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-20 00:00:00 UTC
From: mbrinkho@falcon.inetnebr.com
Message-ID: <4drroa$kd6@duck.inetnebr.com>
Source record: 206905

I'm looking for the short screws for a Yaesu FT23R to put in after the tone pad is removed.

If you have installed the DTMF pad (FTT-4) on a 23/33R and have the screws, drop me an E-mail. I'll pay for shipping, etc.

Thanks.

John:
also have sb-200, would initially suspect "worn out" 572-b's, how is
output on 15m? barring that check the input loading network for 10m,
located in rear of unit, requires removing amp from case, and of course
there's always a dirty bandswitch, cold-solder joint etc!!
GOOD LUCK!!

>higher priced ones. Would appreciate any feedback. 73 Walt ab6re

The Rat Shack DSP is great on CW, worthless for anything else.. No noise
reduction with SSB or anything else... But the narrow CW filter works really
well. If CW is your big mode, it is worth $50 on their sale.

943. Replacing lithium battery in DJ580.

Newsgroup: rec.radio.amateur.equipment

>Greg KO6TH brings up a recurring problem with my DJ-580.... the danged BNC
>connector gets really sloppy... of course, any BNC does this but the 580 seems
>to be worse than others...Anybody solved the problem?

You'll notice that center conductor of the BNC connector on the DJ-580 is shaped kind of like a little fork, and only makes contact with the mating pin on two sides. Higher quality BNC connectors have contacts which completely surround the center pin. I replaced the one in my DJ-580 with one of these, and it's made the connection much more reliable. I did have to file the hole in the case a bit and eliminate the rubber grommet that fits over the connector since it prevented the antenna attaching.

The other problem with the DJ-580 BNC is that internally the center contact is soldered directly to a rigid pin protruding from the PC board such that there is nothing in the system that will flex when stress is placed on the connector. That's why the solder connection between the pin and center contact tends to break. When I installed the new connector, I added a small, flexible piece of wire with a little bit of slack in it between the BNC and PC board pin to take up any stress. So far, it's worked fine.

Be aware that replacing the BNC does require a good deal of disassembly. Unless you're someone like me who's constantly swapping antennas and sticking the radio in a pocket, the stock BNC connection might well prove to be completely adequate.

In article <1996Jan17.202235.28050@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us says...

>The transmit power control is done by IC7 in conjunction with
>D/A converter IC35 pin 12, which is the POC reference from the
>microprocessor. IC7 drives Q39 which drives PIN diodes in the
>second IF to limit drive to the PAs. I suspect that'd have to be
>defeated to get transmit power up outside 2 meters, and that's a
>bad idea because the uP varies POC for VSWR foldback on HF. There
>is no foldback on VHF,

The POC does not seem to be the reason why the radio is not txing outside the 2
meter band. This voltage which changes according to the power output setting is
still operating normally from 118-174. I followed the TX path on 2 meters and everything
appears to work all the way to the 69MHz IF (just before IC3). By "appears to work" i mean
that the if signal looks the same for both a signal inside and outside the amateur band.
It does not look like the ALC is to blame for the low output outside the 2 meter band. The
ALC
appears to be working identically in and outside the band. I suspect that more than 1 of
the
IF or amplifier stages are being turned off by one of the control lines. I have found one
of
the stages to be IC38. This stage is turned on when the radio is on TX and inside the
144-148 range.
The control line that selects this stage is called B8 and according to the service manual
on page 3-8 is high on the ham band. I initially thought that this was the only thing that
prevented the radio fron transmiting. I lifted pin 14 of IC31 which is where B8 originates
and I jumpered the trace that would normally go there to pin 11 of IC32 (L8). Now the
stage is turned "on" on TX everywhere from 118-174. L8 is high from 60 to 200 but T8 is
only
high from 118 - 174 because the cpu wont key the line outside this range . I think it is
just going
to be a matter of time before we find a easy way of getting this radio to work outside the
band.

>possibilities to explore with programming diodes, however. D57, D58,
>D59, D60, D72, D84, and D85 are the programming diodes. We already
>know what happens when we remove D59 and reset, but we don't know
>yet what the others do. They're labeled variously as USA only,

A couple of weeks ago I removed D57, D58, D59, D60, D72, D85 and soldered
6 wires with individual diodes to a 6 position dip switch. I tried all
64 combinations and none appeared to open the 2 meter band. I did not try
D85.

ALso does anyone know if the Main unit PCB is a three layer board? Some of the control
lines appear not to be going anywhere or floating. If you look at the MAIN UNIT pcb

on page 8-3 of the service manual L8 and B8W on connector P4 appear to be going nowhere. There must be another layer which is not shown because I ohm this traces to other points of the board and they are connected. I appears like my copy does not show that layer in bright
red like they show the HPF BOARD on page 8-2. If you noticed the same thing please send me some e-mail.
Maybe my copy was misprinted.

It also eliminates heterodynes, cuts hiss and hum, and has a
reasonably-good built-in speaker. The DSP CW filter works
wonders when your rig has no CW filter; makes little difference
otherwise.

954. Re: IC 706 2 meter Mars mod.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-20 00:00:00 UTC
From: Markus Buehler <mbuehler@access.ch>
Message-ID: <4dq4oa$nmo@pacifica.access.ch>
Source record: 207038

About your question regarding MARS.... with IC706:
Try the modification with the yellow wire... i gave the file bellow to a friend
who has a IC706... he said the modification worked.
73 HB9CPW Marc, Switzerland

The file bellow is copied from:

ICOM IC-706 HF/VHF AMATEUR RADIO TRANSCEIVER
Product Review, Hints and Tips, and Modifications
As Of: December 28, 1995
by Randall Rhea, KG0HW

HINTS AND TIPS

1) Take time to read the manual. The menu system will be bewildering unless you read the manual. One you get used to it, you will find the rig to be amazingly easy and fun to use.

2) You need to set the mode to wide FM to receive FM or TV broadcasts. Tune to the station, press the MODE key until the front display shows FM, then press and hold the MODE key for 2 seconds. WFM will appear in the display, and you will hear the station with nice audio.

3) Don't use the noise blanker on AM. It will not be effective and may distort your audio.

4) Don't use the QSK feature.

5) The rig gets very hot while transmitting. Keep the top of the radio clear to allow air circulation.

MODIFICATIONS

WARNING: Improperly performed modifications can severely damage your radio. I have performed these modifications successfully, but I offer no guarantee or warranty for them. Proceed at your own risk.

TOOLS NEEDED:

1) Small philips-head screwdriver 2) Tweezers 3) Magnifying glass 4) Low-wattage (15 watt) soldering iron 5) Long-nosed pliers

MODIFICATION 1: Enables out-of-band transmit for 1.6 MHz to 54 MHz. This does not enable extended VHF transmit; a modification for this may be available soon. This does not enable AM or FM broadcast band transmit. Your memories will be cleared after this modification,

since you need to reset the CPU.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you. screws.

2) Gently pull up the speaker and set is aside without damaging the speaker or the wires that attach it to the rig.

3) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

4) Move your eyes up from this filter toward the back of the radio. Just before you get to the "D 108" marking, you will see two tiny diodes, two blank spaces, and one additional diode. They look something like this:

D108

[XX] [XX] [ ] [ ] [XX]

Remove this diode ^^^^

5) The second diode from the left needs to be removed. I did this by crushing it with long-nosed pliers. You can also heat it with a low-wattage soldering iron and pull it up with tweezers. Be sure not to damage the other diodes or the PCB. Be sure that you don't apply too much heat, since the heat can damage the PCB and the other diodes.

6) Re-assemble the radio. Reset the CPU by pressing and holding down the UP and DOWN buttons on the front panel and pressing POWER.

MODIFICATION 2: Enables more sensitive transmit above the 2 meter band. (148 to about 162 MHz; after that, sensitivity drops off.) Keeps sensitivity for the FM broadcast band.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

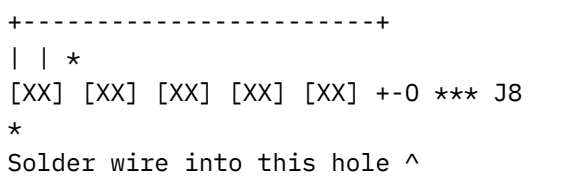
3) Move your eyes up from this filter toward the back of the radio. Follow the ribbon cable up. Notice a wide white connector with several colored wires in it on the back of the PCB.

4) The fourth wire from the left is a yellow wire. Cut this wire. Rather than cutting it, you can remove the connector, stick a paper clip in the side of the connector under the wire, push it in, and pull the wire out. Be careful not to remove the other yellow wire.

5) Re-insert the connector back to its original place on the PCB.

6) Open the bottom of the radio. You will again need to remove 5 screws.

7) Look at the radio with the front panel facing you. Note 5 tiny transistors behind the MENU button. Follow the trace from the middle transistor to a hole just to the left of jack J8.



8) Solder a small wire into this hole. Be careful not to apply too much heat; use a low-wattage soldering iron. Be careful not to damage the PCB or the grey cable coming out of J8. Use a magnifying glass.

9) Run the other end of the wire you just soldered to the front of the radio and attach it to the yellow wire you just cut.

10) Re-assemble the radio.

955. Need HELP with Kenwood TM-701

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-20 00:00:00 UTC
From: ko7v@ix.netcom.com
Message-ID: <4dr2mk$6e7@ixnews4.ix.netcom.com>
Source record: 207039

I have a Kenwood TM-701 Dual bander that won't go on 2 meters. In the VFO mode, pressing the BAND button toggles between 440 and 850 MHz. The memories still work normally, but pushing M > VFO from a 2m memory puts me up on 850 MHz. I tried turning the radio on while holding every button down (one at a time) hoping this would be a RESET command, but to no avail. Anyone have any ideas? I suspect one of my kids "playing radio" may have caused this with some button combination. 73,

Mike Cizek KO7V

Hi Mike

I'm looking at the radio/tech book I bought. It says locate and cut
jumper W1.
Locate and remove diode D9, locate and remove diode D8 and locate and cut
diode D6. However after removing the bottom cover only I cannot find any
one of these mods. I understand they are suppose to be next to the logic
board which probably means they are underneath and on the top. I first
thought this was going to be easy but then I realize getting to the top
may mean forgetting the mods. I just don't see how without getting real
involved.
If you have any ideas please let me know. Let me tell you my ser.#01208
maybe there was a change some place.

Ohh, too many Garys. :-)

I know what he's saying, Tom. D6 and D7 don't have a huge amount
of isolation, so signals can now leak through via the modified
BP filter and *around* the double tuned 2 meter filter while operating
on the 2 meter band. I haven't taken mine down into "pager hell" yet,
so I can't confirm this, but this could be a real problem for those
who regularly do. A word of caution to those thinking of doing this
mod.

> him by building it for him.
>
> Thanks!
>
> Bob

Hi Bob...I looked into building one several years ago when I owned a
551. I enjoyed CW/SSB on 6M but desperately wanted to try FM.
I got a hold of the schematic and studied it for a while...
I soon discovered that there was a lot more on the optional board than
just an FM discriminator and modulator.
There is an IF stage consisting of mixers , filters ect..that is required
before demodulating the FM.
I can't recall the IF frequency but it was an odd number and the
drawing I had was not of great detail when it came to component
values, especially of the transformers and other inductors.
It got to be more of a challenge than I wanted to trouble myself with
so I decided to sell the 551 (I had an offer to buy it) and bought
another all-mode rig with FM in it.

I'm sure that it can be reproduced if you have the time and knowledge.
I'll see if I can dig up the schematics...drop me an e-mail message
just to remind me.

My name is Diann Lorey, I am with the Civil Air Patrol Bay City Michigan Cadet Squadron 20261. We are a youth organization working to serve our community with our search & rescue skills as well as security work for our local community. This brings us to the reason for this request. We find ourselves needing some Handheld VHF FM Radios working in the freq. range of 143 - 150 mhz to permit communications between our ground team members.

Since we are a nonprofit volunteer organization we are asking for your assistance with a tax deducable donation of some radio equipment or assitance in locating some inexpensive equipment as our budget is small. Any help you might be able to give us in our search would be appreciated.

Thank you Diann

Steve:

I have owned and operated a Scout for over 2 years now. It is one of the
finest HF rigs I've had in 38 years of hamming.

I have used it mobile on CW and SSB as well as in fixed operation
and have found it to be very durable and excellent.

For sensitivity and low noise floor, it outperforms any of my Kenwood
transceivers I've had over the years.

Easy to operate, a few little operational quirks, but good solid performer.
I don't think there has ever been a rig built that was "perfect".
In one way or another, they're all a compromise.

I am amused at those who knock the Scout and have never owned one or
operated one long enough to thouroughly evaluate its characteristics.

Good Luck and 73

> changing the tube socket would not be a trivial matter.
> Ken - WB0QNA
>
>>>>
Yes Ken they do, but there are a few minor differnces you should aware of:
The 4-1000a will require more drive.
The 4-1000a is a taller tube (check chimney height).
The 4-1000a is a more rugged tube
Ther is a slight differnce in input impedence.
and last but not least the 3-1000a is alot more expensive.

Source record: 206913

Does anyone know what the insertion loss is everythime you add a PL-259 connection on your coax? I'm interested in the HF band losses. I have two connections between the rig and the amp, two between the amp and the tuner, and will have two more between the tuner and the tuner-tuner, and two between the tuner-tuner and the antenna.

I'm wondering how much extra loss is all these PL-259 & SO-239 connection is causing (not including the loss that each equipment introduces)!

Thanks,
Kory

>top still seems to be fixed to some thing?

Right you are! There are secret nuts that are on each of the pots and the selector knob on the top. Pull the knobs off and then loosen the 3 nuts. (Work them around by placing a small screwdrive in the grooves.) After you remove these, the case will open up. Look in the mods section of the RSGB web pages under the 580 and a complete description will be found there in one of the articles.

I just had mine apart last week to repair cold solder joints.

Source record: 206920

I have had a problem with the internal BNC connection twice. You notice that the set has gone very deaf and that you cannot get into the local repeater. Each time I have found the soldered joint from the centre pin of the BNC to the board to be the problem.

The position is a pig to get to and you have to remove the boards, though you do not have to cut any wires or similar, just let them hang loose.

After the second time it happenned I used a small bit of braid solderd in to make the connection. It is a job the requires a little patience but it worked and I have had no problems since (must be about two years ago since I did the job.)

983. Morse code to text display wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-21 00:00:00 UTC
From: john@MERCURY.CS.UREGINA.CA
Message-ID: <4du55d$irl@sue.cc.uregina.ca>
Source record: 206923
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Hi. My dad is a Ham operator, and asked me if there were some inexpensive way to have incoming Morse code automatically translated and displayed on a CRT. Since I know nothing about Ham radio, I thought I'd post here. I'm sure what he wants to do must be possible; don't know about the inexpensive part though. If anyone can help us out I'd appreciate it. I'd prefer that responses be sent in private email, as I usually don't read these groups.

Thanks in advance.

From: davie@primenet.com
Message-ID: <4dsrkd$q52@nnrp1.news.primenet.com>
Source record: 206927

Hi,

I saw a installation bulletin for the DG5/DK-520 kit which was made primarily for the TS-520, but could also be installed on other rigs like my old TS-900. But, the bulletin never said exactly what this kit did! I got the impression it might be a digital VFO readout you could wire into the radios. Anyone know? If it is a digital readout - any comments on how well it works or what it even looks like? Possibly someone might be able to mail me a copy of the first page or two of the book? Thanks, Dave

>out on 3.5MHz. Is this normal?

John,
You didn't say what you were driving it with, but if the tuned input
circuit for 10m is mistuned or defective the input SWR could be
causing your rig to reduce its output. You may not be getting enough
drive to the amplifier. My SB200 (with 20 year old tubes) puts out a
little over 500 watts on 10m.

From: hmaxwell@netcom.com
Message-ID: <hmaxwellDLI8LJ.46y@netcom.com>
Source record: 206938

If you have the Alinco 6 meter fm transciever & have mastered its use, maybe you can help me to do the same. I'm having trouble simply getting into the offset (+)(-), which works at some times and not others, or so it seems. Don't know if it's me or the rig.

Also curious as to what your FM DX experiences may have been. Right now I have it set up as a base with an omni antenna. Since it only puts out ten watts I'm not expecting a whole lot when the band opens up, but then I've heard that just about anything is possible.

Finally, is it worth getting the decoder option? Thanks a lot & 73

Wynnt,

My post in no way slandered Bill or accused him of anything yet he resorted to the same vitriolic name calling he uses on his "slanderers" in his reply to my post.

This response gave me a great deal of insight into his character and confirmed negitive opinions of him. My intent was to offer constructive criticism but Mr. Cheek doesn't seem to respond well to criticism in any form. Since schoolyard name calling bores me I have no intention of continuing in this "discussion".

Ray,

I use an Astatic 575M6. No complaints so far. Also, it is easy to
put up down buttons in this mic.

Good luck and 73.

1017. Euro FM to US FM tuner conversion...Xtal Q

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-22 00:00:00 UTC
From: blandp1@aol.com
Message-ID: <4e1n70$if@newsbf02.news.aol.com>
Source record: 206806

I apologize in advance if this is not the correct groupto ask this question of. But here goes:

I have an NAD 402 tuner that I purchased in London. I have moved back to the US and am converting it to 120V operation (easy) and 75us preemphasis (slightly harder). In the NAD service manual, it lists 3 10.7Mhz xtals used in the IF section. For Euro use 2 of the three are "Ceramic Filter 10.7MHz, Murata SFE10.7MZ2-A " and one is "Ceramic Filter 10.7MHz SFE10.7ML-A". For US use the manual specifies that all 3 should be the latter (SFE10.7ML-A) type.

What is the difference in these xtals? Can I leave the Euro standard ones in or will I be giving up some quality in the FM rreception?

Thanks for your answers,

-Philip J. Blanda III

It's the lawyers. In at least one case, an irate ham threatened to sue Yaesu when he put a pack in a foil lined bag, it shorted out the batteries and filled his car with smoke. He claimed that there were insufficient warnings in the documentation to protect customers.

The danger has nothing to do with the radio, but with the absence of thermal and overcurrent sensors in the dry-cell cases (which are in the Ni-Cd cases)... and the profit opportunity for lawyers looking to make some money on such a suit.

Hope it is OK to poste these questions here:

I am considering to buy a TH-22. There seems to be more models
TH-22E, TH-22AT and TH-22ATK2 at least, what is the differences.
When was the TH-22 introduced, and has it been tested in QST ?

As long as you don't store/carry the fba-14 in a manner which would
allow its terminals to be shorted out I don't think it really
matters. I have used Ni-Cds, Alkies, and currently am using
Lithium batteries in my ft-51r.
BTW you cannot charge the batteries WHILE they are mounted in
the fba-14 case as the charging terminals are absent. The
external power terminals are there however and I have used the
EDC-12 to power the radio with the fba-14 mounted.
Also, using the fba-14 case it did not matter which battery type
I used, I could only get about 1.5W out on VHF with my ft-51r.
(UHF power out is unknown as I don't have a UHF SWR/PWR meter yet.)

Thanks alot for the reply. I see your point exactly it's all relative. What I really want is to get my foot in the door so to speak. The IC-706 seems to give me a basic HF rig to experiment with 6m and 2m. My antenna situation is very poor at this point due to my living in an apartment. For aprox $1200 this might be the ticket. Yes I would love to get a IC-775 or IC-781 but on my budget it is not an option. Thanks again for the info.

I think you'll find the losses in connectors at HF are minimal. Ground resistance (ground plane effectiveness) is probably more inportant.

However at VHF 50 some - 144, 450 especially 1200 MHz they are real. Thus the advent of the N and C and other connector schemes.

One thing the ICOM 706 DOES not HAVE, is a triple conversion receiver, my Kenwood 690 outperforms the receiver of the 706, much quieter, much more selective on HF and 6 meters.

100 watts on 6 meters doesn't sound any better then 50 when the bands are open! The 736 is a wonderful radio and really outperfoms even my 690...so, it just depends on what you really want to HEAR on the HF + 6 side.

The 2 meter reciever IS a triple conversion according to ICOM....so at least that side is up to PAR...

For the money and the bands covered, the 706 is really quite a package..

1039. PLEASE HELP: Radio Design for Severely Handicapped

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-22 00:00:00 UTC
From: saw@acpub.duke.edu
Message-ID: <saw-2101962031430001@homer.egr.duke.edu>
Source record: 206966
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.shortwave

We are interested in designing/acquiring/modifying a radio (digital?) for use by a severely handicapped individual who was a student before a terrible accident. Only breath-control is practical in this situation. Control of power and tuning are obviously the essential functions needed. We do not want to reinvent the wheel, and are wondering whether anyone has already designed such a radio/interface. I'd be pleased to hear from anyone on this subject, before we start from scratch. The idea here is simply to allow this individual to surf the radio waves, shortwave and other, since disability prevents other activity.

Thanks very much for any assistance.

Very truly yours,

>Does anyone know if there are any mods for the IC706 especially one
>for extended receive transmit. I would particularly like to be able to
>use the rig on 70MHz and 27MHz

Removing D59 and resetting the processor will open up transmit for HF through 60 MHz. I don't know the regulations in your lordship's country, but here in the States use of this radio over the air on 27 MHz would be forbidden since the radio is not type accepted for that service. (Driving a transverter with it would be fine however.)

There is no known mod to allow transmit on 70 MHz as yet. There are a number of people trying to get expanded VHF transmit coverage from the unit, but no one seems to have found the right combination to make that happen, and it looks like that if anyone does it will only open it up for 118 MHz to 172 MHz, and not the 70 MHz band. That's because T8 is only asserted in the 118-172 area of VHF, T8 controls the TR relay. (Note, most uses, aside from MARS/CAP, of the unit over that range would also be forbidden under US rules, yours may be different.)

The radio is an interesting puzzle, but I don't intend to leave any out of amateur band transmit mods in mine after I finish exploring the puzzle. I don't want the possibility of accidentally transmitting out of band to exist in the radio, and I certainly wouldn't condone deliberate transmission out of band.

I am concerned about better out of band reception, however. There is the so called yellow wire mod which improves VHF reception somewhat outside the 2 meter amateur band, but that mod doesn't give the full coverage the radio is capable of supplying. I've discovered a change to the 60-200 MHz bandpass filter that offers a marked improvement in sensitivity across that range, but I've been cautioned that it may make the radio very susceptable to intermod when used on 2 meters. So far I haven't experienced this (I'm in a suburban area not overly plagued with strong pager transmitters), but a bit of caution is advised until this is researched more carefully.

It appears that any problem of this nature would be the result of excessive leakage signals around D6 and D7, the bandpass filter switching diodes. It should be possible to solve that, perhaps by driving the switches harder via a resistor change, or by using diodes with better isolation characteristics. I'm refurbishing an old General Radio unit oscillator to serve as a pager simulator to test this theory.

Would you be willing to post a review of the transceiver? I would be very interested in knowing more about it from the point of view of someone who has used it on the air. QST ran a review of it several months ago, and it looks good, but they didn't say anything about how loud the keying was when operating full break in, etc.

Yves,

What you are looking for is the YAESU ADMS-1B, software and cable for
programming the FT-11/41/51r, FT-10/40R.

It is produced by YAESU and is not a shareware product. You can order
this on the net by placing your order to www.hamradio.com. The price is
either $39.99 or $49.99 US dollars.

Al Wong

John,

Of course inexpensive is comparative, but you should be able to find an XT or 286 PC with monochrome monitor for under $100.

There are 2 or 3 at least shareware programs that are a $10-20 registration that will do this fairly well. The first that comes to mind is the PRO-CW, at least I think that was the one, it included a schematic for the interface also. I played with it for a while, and it worked if someone had a clean fist or sent with a keyboard. I probably still have it somewhere if you can't find it anywhere else. I also think it is on the QRZ CD or home page also.

Good Luck

At HF, how carefully you install the connector on the cable has more
to do with the amount of loss you'll suffer than the connector itself.
With reasonable care, loss per connector should be less than 0.2 db.

I own a Scout and like its simplicity and easy operation. You buy what you need so if working 160m is not a priority then its not part of the total package required to get on the air.

I've worked several DX countries using dipoles and 50w output. I've received several reports on its excellent sounding audio signal. CW reports come back complimentary as well. It does drift a little bit but only during temperature differentials. I haven't had a drifing problem for quite some time though. The receiver is adequate. There are some signals that I lose below the noise floor. A Radio Shack DSP audio amp helps out for some of those weak ones.

Bottom line is this is a very affordable rig. You can get on the air in a matter of minutes.

>Here are some FACTS I have gathered about the Scout from actual on
>the air experience.

I'll add some additional comments which I hope are helpful.

>3. When used mobile, they are very voltage sensitive. On cw their
>frequency constantly changes as engine speed changes.

It sounds as though this might be an installation-specific problem --
poor connection method to power source. I operated alot of mobile CW
on the Scout and this problem was never reported. Maybe this is the
same as the "frequency drift" problem (which is acknowledged in the
Scout's manual, though again, I never experienced it).

>8. Receive current drain is not all that low and would not make a
>good choice for portable battery powered rig.

The LED display draws much of the 600 mA receiver current drain. I
have heard rumors of people making a modification to switch the
display on and off externally, so that once the frequency was set, the
display could be turned off, reducing the drain. TEN-TEC may be able
to offer suggestions here.

>9. The controls feed cheap compared to the import rigs.

The VFO knob feels stiff, and does not offer any adjustments. This
helps avoid accidental frequency changes in mobile operation, while
still allowing intentional quick changes (i.e. without a "VFO lock"
switch).

1064. HTX-212 - Not Bad!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-22 00:00:00 UTC
From: ae758@ccn.cs.dal.ca
Message-ID: <4e0ltj$rne@ra.isisnet.com>
Source record: 206991

Well, I broke down and bought that HTX-212 at the local RS store, despite being sworn to Kenwood. It was only $299 Cdn and it it seemed a good deal, including full CTCSS capability, 30 Channel Memory, 45W output etc.. In fact it was a good deal, undercutting the nearest competition by at least $100Cdn.
Just three things about that really bug me-

1. Non-ham freqs cannot be stored in memory. This is a real drag if you want to keep track of your local emergency services, despite the radio being able to tune 136-173 mHz. This may have been deliberate on RS part, avoiding problems with "mobile use of scanner" laws in many US jurisdictions, but I'd like to have the option. A quick look at the schematic reveals no suspicious diodes lurking around the logic chips, so this won't be easily modified without a new EEPROM (unless someone knows a magic key hold-down combination during power up.

2. The mike and bottom row of function tiles are unilluminated, unfortunately a common trait in many lower cost radios.

3. The PTT button has too soft an action, every time I hit another maritime Canada monster pothole holding the mike, I kerchunk the local repeater. I like a real man's PTT switch, one that takes a real effort to activate.

Generally my findings confirm a review I just saw in the Jan. 96 CQ VHF premier edition. If you can live with objections 1, 2, and 3 you'll be happy with this radio as a mobile or basic station rig.

Erickson GE Monogram Commercial 40 Watt FM Mobile For Sale.
Very Rugged up to 16 channel EPROM progamable.
Frequency Range 136 Mhz - 174 Mhz
All options Duplex, tones, scan, etc.
Currently has 16 Marine channels programmed:
6,8,9,11,12,15,16,18,20,22A,68,69,70,72,79,80A.
Perfect for small business in need of a high quality mobile to communicate
with base or for pleasure boater who requires these already programmed
frequencies.

Technical specs sheet on the Monogram Radio:

Dimensions: 51mm X 152mm X 210mm
Channels: 16
Weight: 1.9Kg with mike
Battery Drain: .4A standby
.8A receive
8A transmit
Programming: PC programming
Frequency Range: This unit tuned for VHF low (148Mhz to 165Mhz)
RF Power: 40W adjustable
FM Hum and Noise: -45dB
Spurious and Harmonics: -70dBc
Channel Spacing: 25kHz
Audio Distortion: <3% @ 1000Hz
RF Out/Input Impedance: 50 Ohms
Sensitivity: .3 microvolt
Selectivity: -70dB
Intermoduation: -70dB

Product Features:
Channel Guard/Digital Channel Guard
Fluorescent Disply
Dual Priority Scan
Sythesized

Field PC Programmable: Microprocessor design provides for personality
programming using an IBM/compatible PC.

Asking $300 cdn (current US Exchange is aprox 38% in your favour)

open to offers of trade for Amateur equipment, like 2M mobile, 6m Mobile,

Date: 1996-01-22 00:00:00 UTC
From: saw@acpub.duke.edu
Message-ID: <saw-2101962050020001@homer.egr.duke.edu>
Source record: 206994

We are interested in designing/acquiring/modifying a radio (digital?) for use by a severely handicapped individual who was a student before a terrible accident. Only breath-control is practical in this situation. Control of power and tuning are obviously the essential functions needed. We do not want to reinvent the wheel, and are wondering whether anyone has already designed such a radio/interface. I'd be pleased to hear from anyone on this subject, before we start from scratch. The idea here is simply to allow this individual to surf the radio waves, shortwave and other, since disability prevents other activity.

Thanks very much for any assistance.

Very truly yours,

Seth Watkins

Good point. Besides, the TEN-TEC amp is advertised as 30 watts--hardly
the kind of power which will turn the head of an avid 11 meter fan!

Sounds to me like TEN-TEC is being a bit over-sensitive and I've written
them to make that point. I also suggested that they sell the 6 meter
transceiver kit as a 30 watt unit (for more $, obviously). That way,
they aren't selling a 6 meter amplifier.

Well, here are some facts that are also worth mentioning:

1) The modules contain a front end pass band filter for RX,
which is generally missing from other rigs, and which is very valuable
in crowded parts of the world.

2) Surely the frequency locked VFO is more sensitive
than a synthesizer. Do not forget that in return you get
a nice and clean signal with very low sideband noise.
(wich, incidentally, helps a lot on receive also).

3) combining good RX signal handling with low current drain
in a receiver is about as impossible as combining low current drain
with high TX output power.

>While you're at it. See if you can devise a way to improve qsk. Or at
>least speed up the response of the relay so it doesn't chop dits and or
>make it quieter.

The keying is totally electronic. Q48 drives a diode switch in the
9 MHz IF to key the carrier on and off. The relay you hear clattering
is RL1 in the filter unit. It's the TR relay. The only delay it has
is a 0.0047uf bypass cap across the coil. I don't think that's slowing
it enough to matter. VR109 is the CW waveform adjust. In conjunction
with C177 and C178, it sets the keying pulse rise and fall times.
Twiddling with it may improve keying. Otherwise, the problem is a
timing problem in the firmware between the time T8 is asserted and
the time keying starts (ICW asserted by IC10 pin 16). Since IC25
is both the keyer and the control uP, it's possible some timing
loop is nested incorrectly causing ICW to be asserted before T8
on initial dits.

I'm not a Morse operator, so I'll ask you to try this test. Set
the radio for manual keying and tell me if it chops dits when
the internal keyer is not used. If it does, then RL1 may be
mechanically too slow, and the source of the problem. If it
QSKs properly with a straight key, then the problem is most
likely in the firmware of the uP.

>Never seem to see a post on the Ten Tec Omni. How do they compare
>with other rigs in the same price class? Are they as good as the adds
>say?

I can't speak for the Omni V, but if you're referring to the Omni VI, it's the best I've ever used. As with the Scout, the radio seems to be a perfect combination of simplicity, features, and performance. I operate mostly on CW, and this radio by far as the best CW characteristics I've used, on both transmit and receive. The radio allows control of the keyer weight, speed, curtis type A or B operation, sidetone pitch and volume, waveshape, and has separate RX and sidetone volumes. I had the chance to open my Omni 6 up to install a filter, and I was equally impressed with the mechanical design and construction of the radio.

I could continue forever on the merits of this radio, but maybe I'll wait until I've had more time and a better setup to evaluate it (currently using a 1/4 wave vertical with no ground plane, and no RF grounds -- in an apartment). In short, it's simply the best I've used in the 8 years that I've been licensed. It's nice to see a radio engineered so well. Opinions may vary.

From: stubstad@ix.netcom.com
Message-ID: <4dv4pg$1mh@ixnews3.ix.netcom.com>
Source record: 207000

I have been elmering a new ham with a brand new fancy HT. I told him to pick up a AA cell pack as a backup to the stock NiCd pack that came on his new HT, because could swap out cheap, readily available AA nicads which he already has a fast charger for, or use alkalines for longest life. This is what I do with my ancient IC-2 radio.

When he got his FBA-14 pack, it had dire warnings about using rechargeable cells in it. I presume that this is just a liability thing relating to the well known meltdown property of shorted NiCd and other low internal resistance cells, and a way to sell more glued shut NiCd packs? The pack seems well constructed and though it is not fused, it appears safe as long as not crushed or dunked in water. Is there something that I'm missing about either the FBA-14 pack, or the FT-11 radio that makes a spontaneous meltdown likely, or is this just the lawyers and marketers talking? I realize that this is an at your own risk proposition, but none of the older stuff was fused (except by springs melting through plastic). I'm just looking for an informed risk assessment, not advice.

1076. ICOM 706 observations... comments?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-22 00:00:00 UTC
From: ga19989@evax01.d51.lilly.com
Message-ID: <1996Jan22.120029.1@evax01.d51.lilly.com>
Source record: 207003

I have had my Icom 706 for about a month now and it's pretty much what I expected, thanks to the comments I read in this newsgroup before I bought it.

Here are a few items that I have not yet seen addressed:

1. Cross-band operation is not possible... (makes it rough to work RS-10 and RS-12 satellites)... at least I have no solution for this... any hints? The preset split is not wide enough, can program in a different transmit freq but won't key.

2. Cross mode operation also not possible, but that's no big deal.

3. One thing that is surprising is that the beep at the band edges is not where it should be on every band... specifically, 80 meters beeps at 3400 and (if I remember correctly) 4100 khz. I see no adjustment for band edges in the owner's manual. Any hints? (yes, it also transmits inside these limits... of course, I transmitted into a dummy load just for the record)

Otherwise, once I add a CW filter*, it ought to make a nice rig for mobile/vacation/field day. (Mine has NO audio problems with factory mike, got good audio reports on 2 meter and 6 meter SSB. Also, working up to 40 wpm full break in is no problem, and above 40 you can adjust the weight control a little to compensate the CW.... maybe I got an improved version of the ones others commented on?)

*Strong adjacent CW signals overload front end to the point that an audio DSP can't handle them, but an audio DSP works fine at separating CW if no strong signals nearby. I find the receiver sensitivity with pre-amp to be as good as my Kenwood TS940. (maybe my 940 is going deaf, but I blame the lack of sunspots for weak DX signals)

Hmmmm.... possibly Ten-Tec simply isn't interested in the effort and
expense involved in gaining the type acceptance required for external
amplifiers below 144MHz.

> According to what I was *TOLD*, manufacturers of legitimate
>solid-state HF amplifiers use devices which die above 25 MHz to

>2-meter brick, though, is far enough away in frequency that more
>extensive mods would be necessary to make it work at the lower
>frequency, so the risk is lower.

Given that virtually every HF amplifier sold into the amateur
market is modifiable to restore 10m coverage (legal for an
amateur to do for his/her own use, see 47 CFR Part 97.315),
I have a little bit of difficulty accepting this explanation.
Furthermore, when you look at Gain vs. Frequency charts of
HF power amplifier transistors, they're fairly linear, I don't
recall ever seeing an HF part that had a sudden drop-off
in gain after 25 MHz.

> The only problem I have with this line of reasoning is that
>Mirage sells a 160-watt 6-meter brick.....

Mirage probably decided the expense of type acceptance was worthwhile
since they sell quite a few amplifiers.

By the way, the type acceptance regulations are for external amplifiers
only; transmitters are not required to have type acceptance, though

both transmitters and amplifiers have the same spectral purity requirements.

From what I've read in the scanner newsgroup, the -dx option allows you to use the SSB filters in AM mode. I'm in parrot mode so can't quote from experience.

Kory Hamzeh <kory@avatar.com> wrote:

>
>Does anyone know what the insertion loss is everythime you add a PL-259
>connection on your coax?

As others have said, in RF design, it is common to assume a connector loss of 0.1 dB/connector. But, a properly installed PL-259/SO-239 connection at HF has a much lower loss. If you have 1KW of RF power and it goes through a device with 0.1 dB loss, the device dissipates 22.6 watts of heat. I have never seen a properly installed connector at HF show anywhere near this level of heat. (22.6 watts dissipated in a connector would quickly melt the center conductor insulation of the coax.) I believe that a more realistic loss is 0.01 dB (2.2 watts of heat loss) mostly due to ohmic loss in the mating surfaces. The impedance bump caused by a PL259 at 3.5 MHz isn't that big a factor. (Not true at VHF or UHF, of course.)

The Raymond Sarrio Company's Ham Radio WWW site is proud to announce a FREE Ham Radio classified advertising page at http://www.csz.com/sarrio.html. This new classified page will allow Hams to find equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear you'er interested in, you are also provided with easy point-and-click e-mail access, directly to the Ham that listed the item.

For those Hams with gear to sell, take note! there is NO charge to list your equipment within Ham Classifieds, and there will be no posting time delays. Your posting(s) will go on-line in our classified search engine immediately. All you need do is fill out a simple forms page, and upon its (point-and-click) submission your "For Sale" classified is immediately on-line.

```
I will be purging the classified listings initially, about once every
month, but that timeline will shorten as our classified numbers grow.
```

Give it a try, and let me know how you like it (we are still beta testing)

: Jim

Jim,

I saw the same warning and ignored it since I carry my spare battery in a plastic bag which prevents accidental shorting. There is little danger of shorting while it is attached to the radio.

My radio is an FT-530. That model will not charge an alkaline pack through the radio because the radio power connection to the battery has 3 pins - the middle one is for charging and the alkaline pack doesn't have a middle pin. To allow charging the alkaline pack with nicads in it, I soldered a small diode from center pin to the + pin inside the radio. Now my FT-530 charges my alkaline pack.

Another shortcoming of the Yaesu alkaline pack is the "splice" between the two case halves is not beefy enough. My pack experiences a 1/2 Volt or more drop when I transmit. The drop is less if I bend the metal contact to exert more pressure when mated. Trouble is, this extra tension doesn't last. I don't have a good solution for this yet. If you do, please post it.

The boatanchors email exchange has been discussing flea market language, and how to interpret it. I thought the discussion might be worthy of a larger audience, and encourage you to join in with your own observations. Here are my own examples of "fleaspeak:"

"I don't know if it works." (Translation: it doesn't work, probably never has.)

"It might need a bit of tweaking." (Translation: Marconi himself couldn't fix it, much less align it.)

"It was used in government service." (Translation: after the govt. technician tried to solder the loose connections with an acetylene torch, it was stored outdoors on a wooden pallet during hurricane season.)

"The dial drive may need lubricating." (Translation: the gears are stripped and all the setscrews are hopelessly frozen.)

"I plugged it in to check that it lights up." (Translation: the light came from the two foot high flames.)

"It doesn't chirp." (Translation: it doesn't chirp because it doesn't transmit.)

"The audio sounds great." (Translation: the 60Hz buzz is faithfully reproduced.)

"I'm selling it because I have two of them." (Translation: I'm getting rid of my parts radio.)

"You won't find one at a better price." (Translation: "Better," in this case, meaning from the point of view of the seller.)

"There are a couple of other people interested in it." (Translation: someone sat on it to tie his shoelaces while walking past the table.)

"This has become a collector's item." (Translation: the manufacturer went belly up six months ago and won't honor the warranty.)

Respectfully submitted,

Jim W8ZR (a sadder but wiser flea-market afficionado)

Yes. Using a bug in the qsk mode makes it sound like a sick chicken. The best I can do is run it with a .1 sec delay. This makes it sound fairly good but still a bit choppy. Increasing the weight on the bug helps. I tend to agree, it's probably the slow relay. Seems funny such a highly intregated rig would rely on an old fashion relay for keying. I am cw only here. Does anyone want to buy a new/used 706?

WA4OSR, are you around?

I have a Brass Racer and the brass seems to be clear-coated in
many areas. The clear coat/whatever seems tarnished and I could
polish it up if I could get through the coating. I suppose I could
just use a paint remover or scrape it clean, and the re-shine and
re-urethane/clear coat the unit's parts, but I wonder what others
have done BEFORE I rip into it...

I've always wondered what the loss is also. I work with fiber optics
and our link budgets allow two tenths of a dB loss per connection. I
hope they are not really that bad!

HF mobile is very often the only viable solution for apartment dwellers.
The IC-706 is a good mobile rig.

>good, but they didn't say anything about how loud the keying was when
>operating full break in, etc.

Hmmm, I'm not certain that I understand your question. The JST245 supports the usual alternatives of Fast-QSK and Semi-QSK. The CW sidetone pitch and loudness are both front panel adjustable. It's very easy to adjust the loudness to match band condx. The pitch also varies the offset of the "BFO", so that when you match your sidetone to the received signal, you are "zero-beat" on the same frequency. Other keying noises from inside the box are very quiet - unless you have the amplifier keying circuit enabled. The built in keyer is very nice.

I'd like to post a full review, but I'm not sure when I'll find the time. The QST review was pretty complete. Their test rig was equipped with all the filters, and they really do make a difference on CW and the digital modes. With the 500 Hz filter I am generally unaware of neighboring QSOs when operating in the 20m digital sub-band. It's a particularly good rig for these modes.

QST always avoids really useful comparisons between rigs, but I will say that I've never used a rig that "hears" as well as this one - and that includes the FT-KD that held a prominent position in my shack for a couple of years.

SSB transmitted audio quality brings consistent rave reviews and many comments that it is "completely free of identifiable artifacts". Nobody says it sounds like "Kenwood" audio, or that it has that "Icom punch", etc. - just "great audio quality". I use a Heil boomset, but NOT the DX cartridge.

It's not usually a priority for amateurs, but I listen to BBC much of the day while working. The audio quality when monitoring SWBC in SSB mode is marvelous - more like loacl WBFM than anything that you've ever heard on the SWBC bands before.

If you have any specific questions I'd be happy to comment from my experience with the rig.

The rig doesn't use relay keying. The relay is the TR relay. Switching
100 watts of RF is still easier with a relay than with diodes. Even
Ten-Tec still uses relay TR. If the relay is slow (I'll have to do some
testing), then we can probably come up with a faster relay that will fit
in the case. The one Ten-Tec uses will probably work.

Source record: 206839

David...I have an FT10R and find it just superb. I have owned 20 or so HT's in my time and this one exceeds FT530 (next best) in audio volume/quality, intermod rejection, ruggedness, portability. Chunky shape, strong SMA antenna connector, good battery design, 5watts out with 9.6volt pack, amazing sound quality. This is amateur version of a military tactical field radio as you may know. I like the FT10 enuf to get the FT40, can interchange battery packs. Programming is standard Yaesu. Manual is excellent as are all the Yaesu current manuals. Get the rubber "case" for the rig for additional ruggedness. Get the rapid charger insert also. Superb radio for $ 289. I used it at -10F on hike around Mt.Washington, worked fine,other radios were useless. MilSpec means something! HI! 73 N1FSK

Hmmm. Lots of people have complained about the rig's QSK feature, so this is an especially interesting report. I wonder, RV109 adjusts the keying characteristic. Since you're set up to measure this, Tom, how about diddling the pot and tell us what happens? It could be that many of the rigs are coming from the factory with this setting misadjusted.

ACC is out of business.

The company that now owns the rights to ACC in Link-Comm (406)482-7515. But they will not help you fix your RC-85. They have great repeater Controllers for $450-$1000 and they even include the same ACC Romeo & Juliet voices.

Our group is changing out the older RC-85's since many parts are no longer available. The new Link Comm controllers have a lot of features for a low price.

Good Luck !

> as to which unit is the best...

Unfortunately, there is no 'best'. It depends a lot on what you want to use it for. I have used the NIR10 and the Timewave 599 side by side and can tell you my opinion. For data modes and CW, I think the 599 is better. For SSB, however, I think the JPS units is superior. For weak signal work, the peak feature, and at times the spectral subtraction NIR is beyond unbelievable. The difference between no QSO and armchair copy is not an overstatement.

The best advice is try them all before you buy...preferably on your own rig. Hope this helps.

A friend of mine has a TS-670 for sale. It covers 40, 15, 10, and 6 meters with 10 watts output. I have seen the rig and it is in great shape. He is asking $400. He also has a 150w 6meter amp (10watts to drive 150w output) for $250. If interested, please leave me email and I will give the name and phone #.

In article n4lq@iglou.com (Steve Ellington) writes:
>While you're at it. See if you can devise a way to improve qsk. Or at
>least speed up the response of the relay so it doesn't chop dits and or
>make it quieter.

Hi All,

I just measured the keying charitеristics of my 706.

No leading edge chop on CW in QSK or conventional VOX CW operation. None at all!!!!! The amplifier relay line pulls low 15 mS before RF appears in the QSK mode. That should be enough time for a typical HF amp relay to close, most require between 10 and 12 mS.

It looks like ICOM did it's homework much better than the big "K" ever did!

I wonder what configuration you are using Steve? Do you have a power amp in line also?

The relay does click, and I'm sure a quieter relay is available. Part of the problem is the relay mounts directly on a PC board. There is no mechanical isolation. It doesn't bother me, but then I drive a diesel truck and listen to rock and roll.

Next I'll sweep the filters.

It works pretty well as a narrow CW filter and as an auto notch
for 40m SSB. Other than that, it does not do very much. Noise
reduction on the unit is designed for CB, not for hams. It will
not do anything about noise from automobile engines. I saw
one on sale for about $40 ... at that price, it works OK.

The FT10R _does not_ have an SMA antenna connector. Whatever type of
connector it uses is totally non-standard, and contains no provisions
for connecting ground. This makes the radio totally useless with any
kind of external antenna. If you can live with this limitation, it's
probably a fine radio. The FT-40 uses the same antenna connector as
the FT-10.

I have both a FT-11 and FT-41. I have had no problems with intermod
on the FT-11, but the same does not hold true for the FT-41, which is
fairly susceptible even with the factory antenna! If the FT-40 shares
receiver circuitry with the FT-41 (as I suspect), I'd be wary about
buying it if you live in a "tough" intermod area.

GOOD GOODIES FOR SALE:

Yaesu FT-736R all mode with hand mic. Very nice condition. Includes manual, power cord etc. Works Great.

This is the radio of choice for satellite or weak signal VHF / UHF work.

Will sell for $1175.00 plus shipping.

****

SOLD Yaesu FT-767GX HF/VHF/UHF ***SOLD***

****

Yaesu SP-767 matching speaker for 736R or 767 with built in audio filters and A/B inputs. $75.00 plus shipping.

****

Yaesu G5400 B AZ-EL antenna rotor with AEA model ST-1 computerized rotor controller.

The ST-1 will run with Instant Trak as well as several other tracking programs and will also tune several radios such as the 736R.

Package includes two 75' runs of heavy duty 8 conductor rotor cable.

Will sell package for $675.00 plus shipping.

****

Daiwa NS-660PA SWR/Power meter. Cross needle, peak reading to 3 KW. $125.00 plus shipping.

****

Icom IC229H 2 meter mobile radio. 50 watts. Includes mobile bracket, DC power cord, manual, box, mic. $200.00 plus shipping.

****

RF Concepts 3-312 solid state 222Mhz amplifier. 120 watts out. $175.00 plus shipping.

****

Wavetek model 162 function generator good to 30 Mhz. Calibrated in 94. $200.00 plus shipping.

****

Shure M-267 line/mic mixer with rack mount. $200.00 plus shipping.

Remember the Courier Royale???

I have one here that is available to collectors.

I remember in its day it was one of the top rigs sold in S9 mag
up there with the Browning and Tram.

I picked one up the other day. It needs some work, probably tubes.
It did not come with a mike and perhaps that is why I do not hear
anything on the receiver. I have some mikes here That I will
include with the set.

I had an offer of $25 from several people before the hollidays.
One fellow wanted it and was sending a check, then changed his
mind. If any of the others that made an offer and I refused want
it now, mail back. First $25 or higest offer will get it.

Just say you want it and I will hold it for you, and send you my
address.

I beleive the band beeps are the point where the analog band switching voltage actually switches. The would be the voltage that is output from the radio to control devices like the 4 KL and EX-627 automatic antenna switch, also like you found where the radio does not Transmit anymore. I do not think the factory was trying to make this the actual U.S. amateur band edge, most likely a poor name for an occurance. May be they should have called is band switch point beep.

No amp. here. Just key your 706 while listening in another receiver. Try it first in qsk mode then switch to semi bk in. There is a tremendous difference. Maybe the tail is being chopped off instead of the head. Even the causal listner can spot this on the air. Using a straight key at 10wpm won't prove anything either. Set you're keyer on at least 25 wpm, hold down the dot lever and listen. My Kenwood TS940 has no effect on character length no matter what the speed. I've been told that it has no relay bounce up to 140 wpm! No, I don't go quite that QRQ.

Now don't get me wrong. This is a fantastic rig and using semi bk in at .1 sec delay is not a huge handicap but cw ops are a bit picky when it comes to qsk!

: No leading edge chop on CW in QSK or conventional VOX CW operation. None

> >Anyone out there that has a Radio Shack DSP that can give me any info on

> The Rat Shack DSP is great on CW, worthless for anything else..

Not true. It's also good for broadcast shortwave . I've found it helpful
when tuning BC SSB SW, eg Radio Havana or RFPI with a Sony 7600G,
and trying to get SW AM BC services not aimed at the U.S. with big ERP.

At $49 clearance price, its worth it if you're wanting to try DSP.
I'm happy with it, but it tells me exactly why better DSP units are $300 and
up, too: this is better than nothing, but doesn't do everything I want.

> No noise
> reduction with SSB or anything else...

That may depend upon your receiver. The SSB in my Sony is barely adequate,
and this unit helps. I dare say if I hung it of the Hallicrafters with the
manual notch filter, I wouldn't notice much improvement.

> But the narrow CW filter works really
> well. If CW is your big mode, it is worth $50 on their sale.

I ought to start listening to CW, and it was worth $50 on sale without it.

It IS probably more of a CB / Scanner / WorldBand kind of accessory than a
Ham item.

>I've been reading this group for about a week, and haven't seen much
>said about the new Yaesu FT-51R ...

>Does anyone have any comments they can make regarding this radio?

Sure, I can.

The FT-51 is far and away the best dual-band HT on the market currently, although Yaesu is rumored to have its successor, a dual band version of the FT-10/FT-40, ready for market in the next 18 months or so. But I expect it will be out before the end of the year.

Anyway, no other dual-band radio touches it in features or ease of use, especially with the ADMS computer interface for programming the unit. Sensitivity and signal rejection, for a broad-band receiver, are quite good.

I highly recommend this rig. I purchased mine with the high-power option and paid less than 500 dollars (US), including tax, for it at HRO in Phoenix, AZ. HRO (despite their detractors) had the LOWEST price in the country (even with sales tax) that I could find. And I called about 12 mail-order houses around the U.S.

As long as Yaesu keeps making radios like this, they have a customer for life. I'm patiently waiting for them to make this dual-bander obsolete so I can buy the latest and greatest. If they do come out with a dual-band version of the FT-10, I'll be selling the FT-51, maybe.

I recently saw a demo of the FT-40 and was blown away, DCS, voice mailbox, milspec, etc... I just wish it had a lighted keypad.

1133. Alinco DX-70 - some more mod ideas...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-24 00:00:00 UTC
From: Joseph Fitter BV/N0IAT <joentam@transend.com.tw>
Message-ID: <4e50un$7n3@tilde.csc.ti.com>
Source record: 206760

Hi All,

Been happily using the Alinco DX-70 HF + 6 rig for about 6 months now. Having even run it in a major contest as a spotting rig, I can safely say that it is holding it's own (with 6 months of guarantee remaining).

I have made all the original wide-band mods, and have been satisfied with the expanded VHF-low band receive. Additionally, I am surprised at the sensitivity down in the "lowfer" end of the band. It does a nice job down there, though synthesizer noise is a bit higher than desired.

Here are some other "mods" that I've done on my rig -- perhaps others out here in virtual radio world have similar or improved ideas on how to get the most out of these super little rigs.

1. I found an MFJ CW keyer, based on the infamous curtis 8044abm chip at a local ham shop. The keyer is designed to be internally mounted in one of the MFJ QRP rigs. As such, the board for the keyer is quite tiny. The keyer also seems to work fine on 13.8 VDC which is a natural match to any mobile power source.

I managed to replace the "speed" pot on the small keyer with a low profile screwdriver settable circuit board mountable pot. I also removed the molex power / key connector jack to save additional room. The resulting circuit board is now very thin and compact...enough so to mount directly inside the DX70 case. I ran the keyer wires out one of the heatsink holes, and used a small 3 conductor phono jack for "paddle input". The jack is connected to the rear heat sink via a small metal "L" bracket and tiny self-tapping sheet metal screw. I can access the "speed" control for the keyer thru the bottom side of the chassis near the ctcss switch bank. I use a "diddle stick" to adjust speed if needed.

While not totally convenient to adjust speed, I ususally leave it at about 25 WPM and all is fine.

Power is tapped from the "atu" tuner molex plug, from the inside of the radio to the keyer. I measure about 40 milliamps at 13.8 VDC, so very little current is required and full funcitonality of the ATU mechanism should be possible.

2. QSK improvements. Like the IC-706, something HAD to be done to improve the QSK performance. The relay inside was far too loud.

I have experimented with a reed relay (quiet, high speed) but could not find one that handles the current. So far anyway, but I have ordered some higher current reed relays and hope this fixes the QSK.

The relays used only lasted about 3 days each...but did improve QSK performance up to 45 WPM with great results. The switching circuitry can handle the speed...just not the TR relay!

3. Filter improvement. I notice the narrow filters are Murata filters. I have ordered some replacement filters with deeper skirts from Murata and plan to install them once they arrive. This is some tricky soldering for a layman like me -- but it's worth a try. The stock filters are really quite good (for being free and included). I was insterested in getting 250 Hz CW selectivity. If I cant find the right filter combination, I suppose DSP is another option.

4. Speaker / Headphones audio. Thanks to a tip from Scott NF3I, I have found a 1K resistor across the 'phones jack improves the audio of my "el cheapo" stereo walkman headphones. This eliminates the annoying low-level audio hiss that is present at very low volume levels.

5. Cooling: A small low-profile 13.8vdc muffin fan mounted atop the chassis just above the heatsink "holes" keeps things very cool. In fact, the fan seldom runs in high speed now since the external fan is forcing plenty of air onto the heatsink. This was not necessary, but nice insurance at any rate. Power for the fan is tapped via the 4 pin ATU molex connector (from the outside) since I dont have an auto tuner for this rig.

If anyone has figured out how to unlock the receive any further I would be interested in hearing more. Someone said VHF hi band could be unlocked too....have not confirmed this or hear any more on the subject.

Thats all for now. Anyone have other ideas? I'd be interested to know them !

Tom ...THis is Steve N4LQ@iglou.com ...I'm the one complaining about the qsk. Not Gary. It can be easily heard on another receiver. I don't know what a 14 ms delay sounds like but it must be pretty choppy. No I don't use an amplifier here. Yes, I agree, they weight control is misrepresented . If it had one, I would crank it way up!

W8JI Tom (w8jitom@aol.com) wrote:

Clark,

Please post any responses to the newsgroup. I too have contemplated having some deep cycle rv/marine batteries as backups, especially when I lived in Japan and had a big fear of earth quakes. Never did it 'cuz I didnt know the maintenance or safety concerns.

I did hear an interesting bit of info on those batteries---

Two ham pals down in DU3-land claim that a dead cells in the batteries can be restored by draining all the acid out, rinsing with plain tap water, then dumping in some good old Coca-Cola and let it sit 3 or 4 days. Then tip the battery back over, reflush with H2O, refill with HCL and presto...battery comes back to life. This is especially true, I'm told, when Salt Water makes its way into a battery cell...

This is what I heard at any rate, and from 2 very reputable hams no-less. Comments or confirmations????

1147. Re: Opinions on the TenTec Scout?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-24 00:00:00 UTC
From: kjones@sun-link.com
Message-ID: <3105d6bb.52934465@news.netrax.net>
Source record: 206874

Just my two cents re the Ten-Tec Scout opinion poll:

I find there is no relationship between engine speed and operating frequency. I wired directly to battery per auto manufacturer's brochure.

Bandwidth: I find that the receive passband width at full clockwise rotation of the control is similar to that of my club's TS-450 at 2.4kHz setting. When the TS-450 is as narrow as it can get, the Scout is as wide as it can be. Guess which set receives crowded-together signals on 75m better.

I wish it had a notch filter. Other than that, it's the best little radio I've found that I actually can operate mobile.

Some early sets (including mine) had a backlash problem with the tuning inductor but Ten-Tec replaced the module with no questions.

I like the set, and I like the company. Any manufacturer that says straight out that not only the warranty is not voided if you open the case, but they encourage it, is okay in my book. We Are Supposed to know what we're doing after all...

Cheers,

That adds up to 16ms to switch on. At 20 wpm a dot is only about 70mS
long, so this rise delay is over a fifth of a dot and not insignificant.
At 30 wpm the delay is about one third of a dot.

>
>73, John, K1FWF

I must agree on their poor QC and soldering. It's not limited
to just soldering, however. I have found that they forget to
tighten hardware, all too frequently. Nothing worse than
having a #6-32 hex nut jammed into the blades of a tuning cap
in a 3 KW transmatch! Talk about sparks flying!

I still buy MFJ equipment, because once you've looked it over
internally and done their QC for them (!) their stuff usually
performs well and lasts for years. It's just a pain in the
neck to have to worry about having something wrong with the
item right out of the box. -YMMV-

>My antenna feedline is RG8X to a outdoor switch box.

What is grounding objective, RF, AC mains/HV safety, lightening or all three at once?

For RF, you are too far from ground for a useful RF ground, and would have to resort to tricks like MFJ artificial ground to tune out ground reactance at each partular frequency. The product mentioned is for HF, and the concept is not practical for higher frequencies with as long a run as you have anyway as it would require too fine an adjustment. Unless you are matching into an end fed single wire antenna which I can't imagine you would be doing above 29 MHz, I don't think that you need an RF earth ground.

For AC mains/HV safety, the third wire ground if it exists, or a retrofit of a third wire ground at least to the spirit of the NEC will do the trick. All modern equipment that requires an AC ground will have a 3 wire cordset or plug. Don't tell the code inspector, but an amateur no holes retrofit could probably be as sordid as copper grounding foil shut through window with 12 AWG wire down side of house to standard hardware store gnd rod at gnd level. Consequences of code fudges your responsibility, not mine. Doubt that you have any HV in a modern VHF/UHF station unless you are running extremely high power.

Lightening is hopeless in a direct strike. If switch box is at ground level before point of entry to house (preferred), adding a ground rod there with an electronic arrester (gas discharge tube type) in the common coax line is probably most practical. Note that while coax gnd connected, this would act like the AC/HV gnd, but has the potentially dangerous property that while connecting/disconnecting ant to equipment, you probably insert your body into the gnd circuit each time if there isn't a separate protective ground path. If switch box is outside window at 2nd floor level, arrester ground could run straight down to ground between switch and point of entry, but not a great idea because of shunt path to gnd in house via coax shield. You'd want to pull coax line into house off of the arrester (hot and gnd) when not in

use to prevent chance of discharge following shunt indoor path to ground, and not operate at dangerous times. Arrester ground rods and circuits should be separate from third wire AC protective circuit to earth ground. Follow surge arrester manufacturer's instructions carefully, above advice is just my best guess.

Source record: 206884

At HF the worries of loss in the connectors are real at high power, but not so much at low power, however I am curious what losses are on VHF.

I am installing a roof-mount antenna, and I'm trying to decide if I want to go through a filter (for pagers), then a preamp, then to the radio, or if the loss would be enough to lose considerable power..

So how much is the loss on a PL-259 at 146MHz, and loss through a BNC if possible as well. Someone told me 1 dB for 259's and .2 for BNCs.. If it is 1dB of loss per 259 I'd be at a big loss going through two boxes each having 259's!

Appreciate it..

1164. 6m amplifiers and legalities

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-24 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4e5ch8$j5n@cville-srv.wam.umd.edu>
Source record: 206891

As I understand it, the problem with 6m amps is that external amplifiers for 6m must be type accepted and sold only upon proof of license if PROFIT is to be made. In other words, it sounds as if one can sell them at cost at will, but is not allowed to make a profit.

This process of getting type acceptance apparently costs roughly $3k, making a profit earned from sales of such an item risky at best, depending on your markup.

On another, parallel note:

I've ALSO heard that since the FCC really doesn't care about the combination of the amateur service and type-acceptance anymore, it is generally acceptable to sell such amps as the FCC has turned away from the issue.

So is Ten-Tec following the rules? Yes. You cannot sell 6m amps without going through the $3,000 type acceptance process. At $60 for the kit, they're probably making $10 profit (really - they say that they make very little on the 6m xverters, and as one who has built one for $95, I believe them).

So in order to make back the $3,000 expended, they'd have to sell 300 kits just to BREAK EVEN.

Taking the laws too seriously? When you're a large company that has existing gov't contracts for expensive HF receivers, I don't think so.

Any comments or corrections?

Use of large (>1" wide) flat braid out the window to a ground rod may help in your situation. The braid will have less inductance.

>of the rigs are coming from the factory with this setting misadjusted.
>
>Gary

Next time I open the case I will.

This is the time sequence on mine Gary:

1.) I close the key.

2.) 1-2 mS later I get a low on the external relay line.

3.) 14 mS later RF appears.

4.) After a 1 mS rise time it is full output

5.) I release the key.

6.) After a 1 mS delay the waveform decays over ~1 mS to zero

7.) The external relay line releases at zero envelope.

I was wondering if Gary F. is using an external PA? If he would tell me his setup I could duplicate it.

The only flaw I notice in my 706 is the weight control is not a real weight control. I've been seeing more and more of that lately, even on keyers.

The REAL weight is ever so slightly reduced on full QSK. The internal relay is plenty fast, and I can think of no way to use PIN diodes without adding a negative supply of 100 volts or more. If I wanted a quieter relay I could likely find one, but the noise doesn't really bother me.

You are right, Don. I have given up keeping a ton of equipment around, but I have a Drake 2B I restored to its orginal beauty, and am even halling it to Texas for a month with me to operate QRP with a homebrew TX from the hotel room. It a better receiver than any QRP receiver around.

I want to get hold of a GSB100 for the Transmitter when I run across one for the other half of the nostalgic rig. Don't plan on owning any more over the water stuff. I can't fix those rigs, and will not pay what it cost to have one fixed. If I by anything elce it will be Ten-Tac.

I didn't use any test equipment to verify this, but I noticed no difference at all in performance. Since the mod is all in the CPU and not in any of the RF stages, it doesn't widen the front end of the radio or anything like that.

Hi Gary,

The other problem I think I will defintly run into is all of the RF
energy getting to the microprocessor. I'm not quite sure how to isolate
it, other than shielding the microprocessor in a metal enclosure.

>Does anyone have any comments they can make regarding this radio?

>Thanks!

>73,

I've had my FT-51R for about 3 months, and am very happy with it.

Nits:
- When the volume is set very low, and you're listening to a VHF signal, then a signal comes on the UHF side, the volume on BOTH bands goes up a bit. I notice this when listening quietly at work, and the volume suddenly goes up.
- Display can be easily scratched if you don't keep it in a case.
- The Spectrascope display is useless. When it is on the display, you can't hear any audio.

Picks:
- VERY small & light
- Good audio quality on TX & RX.
- Scrolling help display, aka:you don't have to carry the book everywhere
- Programmable from a PC with the ADMS-1B software (VERY handy, especially for the alpha display)
- More features than anyone could use
- Several different crossband modes which help when crossbanding through the mobile radio.

The distance should be MUCH less than 1/4 wavelength. From 1/4 wavelength
away the impedance at the grounded end is transformed into that of an open
circuit !!!

Hi Tony,

I fear it's a mask! Ohh-ohhh!

Anyway, 15mS is not noticable except at 40 to 50 wpm to me. So I operate the 706 without problem, but like you I switch my DSP delay out (70mS delay).

The "key" is radio manufacturers ALL need to get a real CW op to look at designs in an early stage. The headaches caused by poor QSK design on CW are all too common with most brands, so I suspect the engineers are not CW operators.

One manufacturer actually designed and markets a CW chip that calls the dot to dash ratio weight!!!! If I was going to go through the bother of masking a custom chip, I'd make sure the thing worked correctly!

Hi Steve,

Yes you're right, it was you. I received Gary's reply before your original post.

I notice a slight reduction in weight that increases with speed on the internal keyer, but the problem is either much more eveident or much more measurable with external keying.

RV109 does not cure the problem. In my rig, if the delay is reduced to 10 mS I get overshoot on the leading edge of the waveform. The best I could do was pull mine down to 13 mS.

When I get time I'll look at the circuit in detail. At quick test it looks like the CPU is controlling the delay, probably because the hardware won't switch states fast enough. But this is really ICOM's job, and in fairness to them they should have the opportunity to respond. I'm sure they know more about their radio than any of us do.

You can locate the problem easily.

If the plate current is normal with full drive, but the the output is low
it is a tank problem.

If the plate current is low on ten meters, it is an input circuit probelm.

The most common tank probelm is improper adjustment. Be sure the loading
control is open far enough. ****DO NOT START TUNING WITH THE LOAD CONTROL
FULLY MESHED*** start at half way open or more.

If it is a tank problem....try to tune it correctly at the lower end of
ten meters, adjust it for max out. Rotate the plate tune cap several
degrees either side of resonance. In one direction, you should find a
moderate reduction in output and then another increase. That proves the
tuning cap is being set near minimum but not beyond minimum C. The "double
peak" occurs when the tuning cap leaves resonance, rotates past minimum,
and starts to increase again.

Along the same lines, if you tune it for max out and pop the top off an
look at the tuning cap position, it should be very nearly "open", but not
all the way open.

If the cap is out of range spead the turns in the ten meter area of the
tank coil a bit and try again.

If it is an input problem there are easy steps to trouble shoot it also.

IMHO the best rig for the bucks is the IC-735. Dynamite radio, longest production run of any amateur transceiver, and you can find a used one for around $600. I'm hanging on to mine so don't ask. :-)

Source record: 206714

I'm considering buying a dual band (70cms/2 meter) handheld. I can choose from the following-I'd appreciate any feedback about how well these models perform!

Yaesu FT 727R
Yaesu FT 530
Yaesu FT51R
Alinco DJ580E/T
Kenwood TH77E
Kenwood TH78E
Icom ICW24ET
Icom ICW2E

Some of these models refer to European specification, but I'm sure any observations about the US equivalents would be equally valid. I want good rf performance on receive-i.e. resistance to intermodulation and images from powerful signals out of the amateur bands-especially annoying are high power pagers on 153MHz or so in the UK. Also a good, clean transmitted signal is important! And what about reliability?

Anything appreciated either via the Newsgroup or you can Email me at al@boltons.demon.co.uk
Thanks,

Al Bolton.

That level of dissipation would only occur if the 0.1 dB loss was entirely dissipative (ohmic) in nature, which is unlikely. The connector loss is probably mostly reflective, due to the non-constant impedance of 'UHF' connectors.

Damien:

I traded in an 850S/AT for my 870. I've logged about 10 hours on it so far so I'm still a novice. Here are my comments:

1. By far, this is the quietest, nicest receiver I've heard. The ability to tailor the band-pass characteristics with the digital filter are excellent.

2. I've enjoyed using the transmitter (SSB) adjustments to tailor my frequency response, "sharpness", etc. I have a stored "sound" for rag-chewing which favours heavy bass, and DX settings with a sharp high frequency response.

3. The CW keyer on this rig will delight any experienced CW operator (It's a Logi-keyer (sp?)). I've also experimented with the computer interface on CW and enjoy calling CQ by typing as well as keying. The adjustable rise/fall time on CW makes distinguishing high speed CW easier. For slower speeds, a slower rise/fall time sounds a bit more mellow.

4. The RCP program is a blast. It's a hobby all by itself. You can design virtual radios based upon templates. The built-in 870 virtual radio seems to work well; I've had problems "loading" saved radio states but this might be unique to me.

5. Even with all the features, menus, etc. this radio is extremely easy to use. You can be up and running within ten minutes of unpacking the radio. You will also spend many hours reading the manual and fiddling with the 60+ parameters on the software menu.

6. The list price is rougly $1,000 higher than the 850S/AT, however if you can spare the money, it's well worth the difference.

Hope this helps, Damien.

73,

[Jim Nitzberg]

1194. FM BC IF Filters

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-25 00:00:00 UTC
From: rcarpen@DGS.dgsys.COM
Message-ID: <Pine.SOL.3.91.960125054719.7942A-100000@DGS>
Source record: 206721

blandp1@aol.com asks about replacing some of the Murata IF filters in his FM BC receiver to change from European to USA reception. To a first order, I would expect that no difference would be noticed. Probably the filters for Europe make the receiver a little narrower than the USA filters.

In the USA, FM BC stations heard in a given metropolitan area area on channels 800 kHz apart (in theory). In fact, in the densely populated northeastern part of the USA, nearby stations may be on channels 400 kHz (sometimes even 200 kHz) apart.

European FM BC stations may be 300 kHz or 500 kHz apart, as well as the common USA spacings. Thus one might expect European radios to be a bit narrower. Something like the 9 kHz AM spacing vs. the N&S American 10 kHz.

Hi,
I have a FT40 and it is the cat's ass! Fit's in my shirt pocket, and looks like it could take a LOT of abuse (not that I have been testing that) I've been told that it sounds good on the air. I bought the 99 channel version, without the silly DVR. The only thing that I thought the DVR would be useful for is to use the radio as a simplex repeater, and it won't do that, apparently.

Btw, David, how is the rubber case you are describing? is it the RH1 or the CSC-xx case? what does it look like, and how does it protect the radio? (Even a mil-spec-tough radio is nice to keep from scratches and dings!)

Source record: 206773

I have been using a TS-870 S for a while now.
I am quite pleased with the performance of the radio and have no major complaints. The DSP does take some getting used to and it would be nice to have more features with the DSP so that one can have the noise reduction and the autonotch on at the same time. Currently you can have only one of the three options working at a time (noise reduction, beat cancel or auto notch).

The computer interface works great with my logging program (LOG-EQF)
I think the radio is much quieter than any other radio I have heard. I used to own a TS-850 before.

I spend a lot of time on FSK and I can truly copy a signal that does not register on the S-Meter.

The DSP technology used is applied in the 4th IF at approx 11KHz. The DSP also leads to the mic gain and carrier settings having to be turned up more that what we are normally used to (7'O clock).

The transmit equalization works well and offers 3 options...a bass boost, treble boost or a comb filter (cuts oout background hash),

I have a bunch of reports from contestors who used the radio. The reports are mixed with the general feeling that the radio is quite good. The front end does tend to breakdown if you have another strong signal - I mean a KW next door. This is of no concern to me.

CW is fantastic...so is the keyer.

Al in all it is a lot of radio for the money and I have no regrets

From: "Gary P. Fiber" <gfiber@halcyon.com>
Message-ID: <4e80m2$6e@news.halcyon.com>
Source record: 206778

The battery is 3.35 volts. The ram draws NANO Amps of current, and the battery is able to source Milli amps of current, so it should last 20 to 25 years. To change the battery you will need to continue to provide the voltage the battery is now providing before you remove the original one.

This type of system has been in use for many years in many devices. Many companies is a capacitor in the place of the bettery, also the battery is only in use when the radio is turnrd off.

Most likely you are best to remove the ram board and send to ICOM, they charge $32.50 plus return shipping to renew the battey should it need it. Do not worry until the battery gets below 3 volts.

: Anyone know where it is? Thanks, Mike KS4DA

There is a copy of the QRZ Database online. I can't remember the http address at the moment. Any Ham Radio Search on the Web will turn it up though. Also you can access the current Call signs at Http://www.ualr.edu . The Ham Club at University Little Rock has a real good database on the system there. Also you can ftp to ftp.fcc.gov and they post the daily files for the new call signs about 11:50 pm each night. The Ualr database gets its info from here as well

I'm not with QRZ, UALR, OR the FCC. Just some locations I've found on-line with Callsign info.

Source record: 206784

I agree, it is a fantastic radio with an excellent receiver. I don't know where this stuff about the receiver being poor on CW came from! Nor, do I think the controls seem cheap. In fact, I feel quite the reverse. The controls on a TS 50 or IC 706 feel cheap to me. I've not had a problem with drift at my normal 30 wpm speed and I have never experienced drift due to changing engine speed when the rig was used mobile. The Jones filter is terrific and the selectivity is far better than the TS 450, FT 890, IC 735, TS 50 or IC 706 that I owned. I would purchase another Scout in a heartbeat. A PTO receiver is quiet and selective (if you have ever used a Corsair, for example, you know what I am talking about). It is just a darned good radio and well worth the price. If you want all bands and have antennas for all bands and really do work all bands, then ,indeed, another radio may be competitive in price. But, really how many people work all the bands all the time? -- very few. If you want to be avid dx'er (which I am) or a contester (which I enjoy immensely during casual participation) then, obviously, the Scout is not the radio you would want in the first place. At the same time who would use a TS 50 or IC 706 for these purposes? It depends on what you want to do. For a great basic radio with an excellent receiver then the Scout is a great choice. By the way, I have used the Scout with a 7 amp hour gel cell in portable operation and never received a report of drift or chirp as the battery voltage dropped -- even down to 11 volts. I would get an easy 2 hours of casual CW QSO's from the cell before recharging. The bottom line is --- a lot of the negative comments I've seen are from people "who knew somebody" or "heard from a guy" and so on. They don't seem to come very often from actual owners of the Scout.

I have no connection to Ten-Tec. I just think they are producing a fine product in the Scout and if you should ever need service, you will not find any that is better.

> Heil Heil here we come....

Well, one thing that Kenwood did was to connect the shield of the mic output (the return side of the mic signal, pin 7 of the mic connector) to the metal of the MC60 base. This connection is made at the mic amp circuit board on/off switch on the bottom of the unit. The possibility of introducing rf can be reduced by disconnecting the mic shield at this point. Now you can operate the buttons on the base of the mic without touching the mic shield. The mic shield will still be connected to the shell of the mic itself, so you may want to avoid touching the mike shell while transmitting. I realize that there are bypass caps at the mic input to the radio, but this doesn't seem to alleviate the many problems Kenwood users have with rf in the audio. Note that pin 8 is the chassis ground for the push to talk switch and is not supposed to be connected to the mic shield ground out side the radio in order to avoid ptt circuit current being introduced in the mic circuit.

Message-ID: <DLqMrC.49E@iglou.com>
Source record: 206786

Now this is starting to make some sense. However, I have found the dots are chopped with the internal keyer just as bad or worse than external keys. The problem maybe one of perception in that what I hear in the monitor doesn't match the actual transmitted signal. The monitor's cw sounds rather heavy while the acutal signal is rather light and badly in need of more weight. Thanks for all your research on this!

: In any event, what I've found isn't a leading dit chop. It appears to be
: an unitentional keying weight reduction when an *external* keyer or hand
: key is used, and appears to be software related.

Ah so. If a complete element is sent with only a time delay, then the only issues will be sidetone and the availability of a window between elements to listen for full QSK. At some point a lagging sidetone will confuse the sender, but I don't know whether the 16mS in enough for that or indeed whether the IC-706 sends delayed sidetone along with delayed key down. Centainly my headest audio DSP, with an order of magnitude greater delay, has to be switched out on transmit before I am able to send anything.

Sounds like nice work. I hope that the firmware is socketed to allow folks to more easily benefit from any later improvements.

Regards,

>Someone told me 1 dB for 259's and .2 for BNCs.

If the PL259 is propperly installed, it will have negligible
loss on VHF. Henry Radio istalls them internally in the output of a
KW-amplifier at 144 and there are no problems.

BNC is not a good option, unless cable lengths are very short
(a few feet only) and you can use RG59 type cable. A BNC connector
with RG213 is mechanically not a good idea. The loss in a PL259
becomes of course prohibitive on any frequency, if corroded.

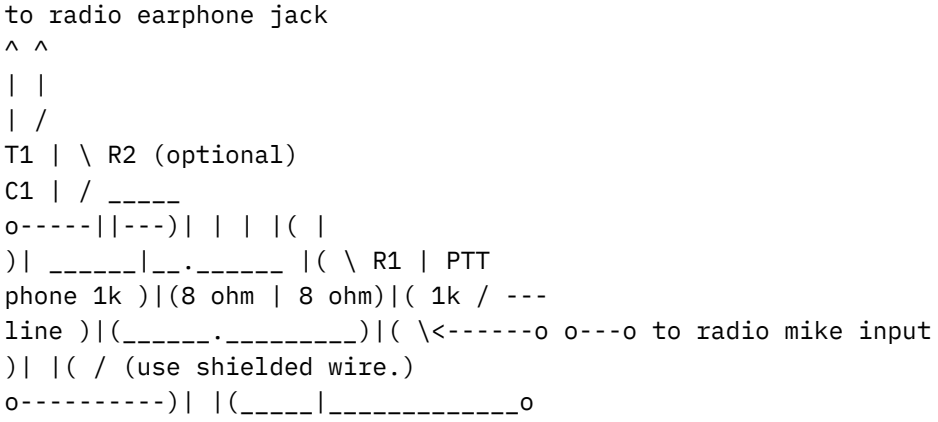
PHONE PATCH FOR HANDHELD RADIOS

This circuit was published in _73_ magazine ~10 years ago. I've built
lots of them. Push-to-talk circuit as shown works with most
handhelds, which key their transmitters when a dc path through the
microphone is completed. Base/mobile rigs use a separate push-to-talk
line.



Push-To-Talk circuit as shown works with most handheld radios.

C1 1 uf 200 volt non-electrolytic.
R1 ~5k screwdriver-adjust pot to set microphone input level.
R2 resistance to equalize speaker and patch levels.
T1, T2 Audio-output transformer: Radio Shack part # 273-1330
(center taps not used).

>At 30 wpm the delay is about one third of a dot.
>
>

Hi Anthony,

I probably need to explain that better. I may have misled you.

This delay does not mean the character is "clipped", it simply means the beginning of the character is delayed in time. Nearly every rig has always done this, from grid block keyed 1950's era EF Johnson transmitters to the new DDS rigs. The reason this is done is to give the rig time to make the transition to TX, and to allow the oscillators and other circuits time to settle. Waveshaping also has to be added to control clicks.

The secret to sucess is the radio should delay the RF "tail" the same amount! If the TX start is delayed 10 mS, the manufacturer should add a 10 mS tail before the RF stops.

Unfortunately I have no easy way to measure the software delay at the end of the character when using the 706 internal keyer other than comparing the length of the sidetone to the RF output, but it looks (on the scope) and sounds (on a separate RX) pretty normal. So I *********assume******* with the internal keyer everything is delayed properly or very close to the proper amount.

Kenwood typically delays the RF turn on 5 to 15 mS. The ICOM 751A does this also. I had to actually increase the delay in my 751A, because on large splits (like working JA's on 160 meters-1910kHz to my tx freq of 1803 kHz) the VCO took so long to settle the radio actually swept a big click from ~1870 down to 1803! Since I increased the tail time of the transmission an equal amount as I increased TX delay, the effect on character length was zero!

The only negative effect this **very necessary** delay causes is the QSK receive window is shortened (in a transceiver). The RX window shortening is equal to 2x the TX delay, or 20 mS in my example.

I just checked the 706 with an external key, and I think I may have found a software error that decreases the weight of external keyer inputs. But

in fairness to ICOM, I need to talk to the engineers before I post it here. I faxed them the details earlier today.

In any event, what I've found isn't a leading dit chop. It appears to be an unitentional keying weight reduction when an *external* keyer or hand key is used, and appears to be software related.

1226. FS: Standard (Heathkit) Dual-Band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-25 00:00:00 UTC
From: Chester Bowles <bowles@cmf.org>
Message-ID: <4e82nn$ros@news.monad.net>
Source record: 206798

For Sale: Standard (made for Heathkit) 2/440 HT - $225 shipping
included.

Model HW-24HT
Soft case
Wall Charger
NiCad battery
Battery case for AA batteries
Instruction manual

High power (@12VDC) is 5 watts. Low power is 400 mW.
20 memories (10 in each VFO)
Scanning (pause or busy)
CTCSS encode
DTMF keyboard
Auto power off
Battery save
Two VFOs
VHF receive - 130.00 to 169.995
UHF receive - 418.00 to 469.995
RF attenuator

Some comments: This is a great radio--excellent audio and a fine
receiver. Much better at dealing with intermod than my Yaesu. I've used
it quite a bit, but always with the soft case, so it is really in
pristine condition. I bought it new in the late 80s as Heathkit was
going out of the kit business. While it is not a huge radio, it is not
small like some of the newer models--it weighs 17 ounces. I'm selling
the radio only because I have a Yaesu which is smaller (I hike a lot and
weight is important). I also recently bought a Standard 508 which is a
great travel radio. I certainly don't need THREE HTs.

From: artburke@solar.sky.net
Message-ID: <4e8mgh$67p@alpha.sky.net>
Source record: 206799

My apologies to anyone this offends. I have a CDE antenna rotor I would like to sell. I honestly don't know what it's worth, but I will entertain whatever seems like reasonable offers. This unit will handle (according to the manual) up to 15 sq. ft. when mounted in a tower, and 7.5 sq. ft. if mast mounted. The rotor (and controller) is abt 10 years old but in very good condition. I used it at my previous QTH to rotate an antenna that was about 10 sq. ft. and never had a problem. Am now living in yuppieville (no antennas, no satellite dishes = no fun!).

If interested, please post to my e-mail. Thanks.

Scott:

Your point is well taken. I think there are several approaches to
the hobby you can roll your own, buy used, buy the newest and best.... I
made the comment earlier today that ham radio was built on the idea of
doing the impossible with little or nothing. QRP people working several
countries on 10mw or less. What I find is that you can really get lost in
the equipment jungle out there. I have found a least out west the used
gear pickings are quite slim. Most ham fests are not well stocked with
used gear. There are the national publications and big stores but to new/
returning people like myself I don't remember what model's corispond to
what gear. Can you suggest a book or article on good used rigs. I know in
the last few years some lemons have come down the pipe line. I think that
my intial question is quite fundamental NEW hams starting out need some
guidance in getting gear. HRO no offence intended is a nice store but
they're in business to make money and they rarely take the time to explain
things to new comers. What's been your best luck in
finding used gear??? Well at this point I'm still sorting out what to do
your suggestions are well taken and I'll look into things more. Thanks
for the help. If anyone else reading this would like to offer comments
feel free to e-mail me back.

Thanks Again

>Feroz, 4S7FG/WU9N
>

Feroz:

I've experience the exact same situation with three radios in a row from kenwood, my 440, 850...and 870! The amount of RF getting into the MC-60A varies with frequency, WX, and amount of power I'm using. I've learned to keep both of my hands off the mike when transmitting with any high level of audio. This helps tremendously. In addition, I did all the ferrite beads, etc. RF seems worst when I've got one hand under the base of the mike and the other hand around the top, holding it, while the speech processor is on. With normal audio, and my hands off the mike, I don't have too many problems.

I also noticed that the hand held mike doesn't have any problem! Maybe it's time for us to try a Shure 444 or Heil mike!

Good Luck, Feroz.

I sent something very similar to the below to support@grove.net --
it should interest the readers on this group -- and they might be
able to help out as well.

It is a inquiry pursuing something someone whose email address is no
longer good who posted the below quote to the Rush Limbaugh FAQ
(see below).

Thanks! -- Roleigh Martin (rol@uhc.com)

P.S. Please also reply by email to. Also, does anyone know what is
the current email address for:
Kenneth Carlson <carlsenk@seq.oit.osshe.edu> -- this address is no
longer valid. Thanks again!

==========

To - support@grove.net

Dear Sirs:

For an writeup I'm doing on what to do if you are a diehard Rush
Limbaugh fan who lives in an area where there is no local AM radio
station who carries his show. I'm touching on Shortwave and
Satellite Alternatives. I am quoting from some email and usenet postings
pertain I believe to a product you sell that I want to ask you if so, and if
so, what all has to be ordered and at what cost. I'd like to give my readers
enough information to order a complete kit from you.

I reprint this part of the Internet Rush Limbaugh FAQ, per the written
permission of the FAQ posters:*

"Q7: What satellite channels carry Rush's Radio and TV shows?
A7: Kenneth Carlson <carlsenk@seq.oit.osshe.edu> writes:
Rush Limbaugh Radio Show on Satellite:

I have had a few inquires for satellite locations, since Waterfront
Communications has moved to different satellites. You of course, have
my permission to post. The United States Armed Forces Radio and
Television Service (AFRTS) broadcast live, the first hour of radio
show on Spacenet 2, Transponder 20, 7.40 MHz. On this feed will have
his national show and Armed Forces PSA's.

The Rush Limbaugh Radio Show is broadcasted to radio stations on
SatCom C5, Transponder 23. This feed is digital, thus needing special
equipment to pick it up, which cost thousands of dollars.

There is another radio show feed on Galaxy 4, transponder 3. This SCPC which requires a receiver for @$US500 dollars. On this feed you will get the national feed, PSA's and bogus commericals that Rush's Radio Show produced."

My question to you is this. Regarding his last paragraph, is he referring to something like what is shown on your web page: http://catmac.grove.net/CGI.SPG?L=F&P=RCV+27

SCPC-100 Satellite Audio Receiver
Receive Hundreds of SCPC Radio Channels on Your TVRO System!
RCV 27
Years ago most radio networks--ABC,
CBS, Mutual, NBC, NPR and others
distributed their programming by
telephone lines or microwave systems.
Single Channel Per Carrier (SCPC)
technology has allowed these networks
to use satellite transmissions to their
affiliates and users.

Now you can expand your home satellite system to receive all of these "hidden signals" and programs with the Universal SCPC-100 Satellite SCPC Audio Receiver.

The new SCPC-100 receiver is the first high quality unit that is affordable, rivaling many commercial SCPC receivers costing thousands of dollars. Features include:

Stable microprocessor--controlled tuning with two buttons. No knobs; frequency agile. 50-channel program memory with instant one-button recall;Non- volatile; holds memory when power is off. Receives entire 950-1450 MHz LNB frequency range from your satellite system. Easy-to-read 1/2" LED's; 4 digits, 7 segment numbers. Receives high quality music from hundreds of stations; Simple 3 minute hook-up; easy to use; no user fees or subscriptions required for reception. Receives all C- and Ku-band SCPC signals and programming.

Unit made and assembled in the U.S.A.
Manufacturer: Universal
Price: $399.95
Shipping Rates
US Rates: UPS 2nd: $5.50 Priority Mail: $7.50
Canadian Rates: Can App: $8.00 Can UPS: $9.00
For International Shipping Rates call or E-Mail: order@grove.net

Is the above capable of allowing U.S. citizens who are living in the USA in areas where they are not near an AM radio station that carries Rush Limbaugh, the Radio Show, to get Rush's Radio Show via the "feed on Galaxy 4, transponder 3. This SCPC which requires a receiver for @$US500 dollars. On this feed you will get the national feed, PSA's and bogus commericals that Rush's Radio Show produced." [By the way, what is a "PSA"--do you know?]

If your receiver is what is needed, what other things will people have to order: eg, perhaps antennas, masts, cables, directional-rotators (is that what it is called?), descramblers or decoders--what will they need to order? I'm interested in a fully spec'ed out items of things to buy but I do not want to recommend to the readers any frivolous, overkill items.

Last, do you know if the above satellite feed is capable of reaching all across America, including Alaska, Canada, and Hawaii?

Thank you for your attention. I will want to reprint your reply, so please make it specified in your reply that you are aware and okay such reprinting in a commercial book.

Thanks! -- Roleigh Martin, 5511 Malibu Drive, Edina MN 55436

==========

P.S. Regarding the "*" footnote, I got written permission to reprint the whole FAQ, which I'm including in the Appendix. I do focus on this paragraph too.

Amateur radio operators (hams) are creating worldwide havoc, how may you ask ? well these seemingly harmless radios emit radiation across the world. The scoundrels that use transmitting devices actually transmit radio waves that can cause cancer and genetic havoc, remember there has to be a lot of power to send a voice signal from Canada to Africa !! at this very moment radio waves are being bounced at the ionosphere, hemisphere whereby they bounce off this enevelope sourounding the earth and are reflected into another part of the world !! radiation galore ! Not only is radiation harmful to humans, but what about the catastrophic mess thats done to our television and radio reception. You can be sure that a lot of these scoundrels build homemade equipment in the darkness of their basements that exceed the rules of society, creating further disaster to the environmnt. What can we do ... well perhaps taxing the operators to a hefty sum would suffice, you see most of the radio transmitters have to be licenced, most are ?
contact your local member of parliment or senator and strongly suggest that the taxes for licencing be raised greatly, we all can use the extra finances for worthy projects, like feeding the hungry children of the world.

xx>Heathkit HW101. This is real amateur radio, when blessed with the
xx>opportunity to own and operate one of these sets. I would rather own a
xx>boat anchor than one of the new transitorized radios today. Real amateur
xx>radio involves doing for yourself, such as building your own antenna beam
xx>or stringing a long wire from one tree to another...it's a hands on hobby
xx>with real rewards. I love ham radio and I love the old boat anchors. Just
xx>my 2 cents worth.
xx>73's KB8YVN

xxA boat anchor is a radio that doesn't work, burned up, non fixable,
xxbasket case, (dirty junk that weighs too much to take to the hamfest
xxto sell for parts). Obviously your HW-101 works, and so does my HW-100,
xxHeath DX-60, Drake 2NT (YES IT'S A REAL CW RIG!!,An antique curiosity nowadays!)
xxThe tube rigs sound great and are easy to work on, and you dont need a twenty
xxthousand dollar spectrum analyzer to tune 'em up! We must respect the Hallicrafters,

xxNationals, Johnsons and Drakes as they pioneered ham radio as we know it today.
xxOh yes...anybody ever heard of a Collins KWM-2? Or anybody ever heard one on the
xxair? What a big, loud fat signal!! I like the new technology just fine...packets a lot
xxof fun, but anybody who hasn't played with a genuine warm classic tube rig is
xxmissing a great experience, as well as being educational.

xxTake care of the HW-101!!

Bill, good input. It is possible to interpret your anecdotal information to imply that Renewals work really well in amateur service, contrary to popular opinion. I'm not clear on your data. Please give more accurate details on your operating experience.
During your hour walk, how much time is spent squelched, normal audio and transmitting at what power level? How many charges have you put on an individual battery? Do you run them till the radio sez they're dead? How long they take to charge is some indication on how flat they were.

Now for my anecdotal experience. I tried a pair of AAs in a Standard C508A. I did it for two reasons. 1) I don't use it much and liked the idea of long shelf life. 2) The radio output power is very sensitive to voltage and I thought the 1.6V would help.

Well, the output power was up, but not for very long. The loaded voltage quickly dropped to the level of a NiCd. And it kept going down. Slowly, but it doesn't take much to get the output power below 70 mW.
After two months of light use (probably 30 hours of high battery save and almost no transmitting), I was still getting out 60mW.

I opted for 800 mAH NiCD's and sticking it in a charging stand once a week. If I keep 'em topped off, I can get over 200mW out.

Story might have been different if I could have charged Renewals while in the radio.

Doug, the FL-32 installed in my IC-735 is quite a bit better than the
passband tuning alone. No, I don't know how the PBT compares to the 751.
I can even use the PBT in addition to the FL-32 to tune out the last
bit of adjacent signal.

I looked at the CW filters once, and the difference is center
frequency. The YK-88C and YK-88C-1 are not interchangeable
beyond the circuit board. I think that the SSB filters are
different, though. Check the manuals and you will see the specs
for center frequencies. No reason why it should be different
for SSB (well, not much reason for CW either, thanks Kenwood :-)

>CTCSS Encoding and Decoding

Continous Tone Coded Squelch System, often called PL, which is a Motorola trademark standing for Private Line, or referred to as Channel Guard, a GE trademark. CTCSS is the generic term. It's a subaudible (low frequency) tone that you can transmit (encode) to access repeaters that use CTCSS access control (decode). Many repeaters also transmit CTCSS, so having decode on your rig means it'll unsquelch only when the repeater is active, and not when the howling pager crud comes to visit. So having both CTCSS encode and decode is valuable, but if you can only have one, encode is the more valuable one. Use of CTCSS is becoming common on 2 meters, and has been common on 70cm for years. If you are going to access CTCSS squelched repeaters, you need it.

>Front end interference rejection

What most Japanese HTs don't have. This is important. Without good front end rejection, pager crud and howling intermod will be a problem in most urban areas. Wideband front ends are undesirable for this reason because they need tracking filters (preselector), and few radios have them. It's easier to get good front end filtering in a ham bands only radio, like the Radio Shack HTX202. Besides preselection, the other factors leading to interference rejection are a high standing current in the first RF amplifier and a high intercept for the first mixer. Since both of these require more power, they generally won't be found in HTs (due to battery life constraints), but may be found in some mobile and base radios.

>SSB (I assume means "single side band") as apposed to what?

The most popular modulation on 2 meters is FM (usually used in conjunction with repeaters, though simplex use exists too), the second most popular is AFSK over FM (packet), the third most popular is SSB (weak signal voice, satellites, etc), and the fourth most popular is CW (again weak signal use). Now *all-mode* radios will

have all of these modes, but most radios on the market will only have FM (which will also handle AFSK over FM of course). In particular, HTs will only have FM.

>SWR (I assume means "standing wave ratio") what does this tell me about >antennas?

Not as much as you might think! A low SWR means that the impedance of the antenna is matched to the characteristic impedance of the transmission line. This is usually a good thing (though there are cases where it isn't, IE transmission line transformers), but it doesn't necessarily say much about the signal you'll radiate. More important are the pattern and efficiency of the antenna, and the foldback limit of the radio.

Most radios will happily pump full power into a line with a SWR as high as 2:1, and what isn't lost to line losses will *all* radiate sooner or later. Since a non-unity SWR means that some of the energy will traverse the transmission line more than once, line losses will be lowest with low loss cable, which is also true in general of course. What this really means is that if you use high loss cable (eg RG-58) you'll be more concerned about a good SWR match than if you use low loss cable (such as hardline). But, because line loss is high, your SWR meter will read a lower SWR than actually exists when you use poor cable, a Catch 22. For example, a long run of RG-58 that's open at the far end can have a very low SWR reading at the transmitter end, but be transfering *zero* power to a load (makes a pretty good dummy load at UHF though).

More important are pattern, gain, and most important of all, height. At VHF, with its line of sight limitations, the higher the antenna the further away will be the radio horizon, and the greater will be your effective range. There's a practical limit, where feedline loss becomes greater than height gain, but the higher the better is the rule of thumb.

You *can* infer some things about antenna efficiency from SWR curves. An antenna with a very broad very flat SWR curve will generally be lower in efficiency than an antenna with a narrow sharp SWR curve. That's because loss loading flattens the loaded Q of inefficient antennas. With certain types of simple antennas, you can also infer some things about the antenna resonant frequency from SWR measurements, with some antenna types showing the lowest SWR at resonance. By using the Smith Chart, you can infer quite a bit about the antenna, but the most important factors require a field strength meter and actual antenna range measurements of the pattern and gain of the antenna.

In general, amateurs measure SWR because instruments to measure it are widely available, and fairly inexpensive, and the measurements

are easy to do. But don't put too much importance into having a "flat" SWR (example: a dummy load has a perfectly flat SWR, but is a lousy antenna). Knowing what a particular SWR infers is more important than any absolute reading, and other instruments will tell you more about antenna performance than a SWR meter (for example a field strength meter).

Most Yaesu radios can take a lot of abuse. My FT-11R took a tumble out of a jeep traveling about ten miles an hour, bounced on the pavement and skidded about 30 feet before stopping. Aside from one corner of the Yaesu softcase being scuffed, the radio was fine. My heart on the other hand...

One of the reasons I bought the radio was because a Yeasu Rep demo'ed this radio at HRO to me, by removing the battery pack and tossing the radio onto the floor about 10 feet away.

As for DVR on the FT40, it appears quite useful despite its limitations.

> Btw, David, how is the rubber case you are describing? is it the

The case is actually a rubber bumper/holster much like the yellow bumper that Fluke DVM's come with. Unfortunately, the Japanese, for some reason, think that Americans don't like color, because you can only get the rubber case here in the US in black. But in Japan, Yaesu markets them in bright colors, like safety orange. Spiffy.

Hello,

I hope this isn't a waste of your time, but.....

I am thinking of purchasing my first 2-meter radio. In shopping for a unit I don't understand all of the features. Any help would be appreciated on the following terms and how they relate to a low-to-mid range radio.

CTCSS Encoding and Decoding

Front end interference rejection

SSB (I assume means "single side band") as apposed to what?

SWR (I assume means "standing wave ratio") what does this tell me about antennas?

Any info can be posted to this news group or emailed to me at: chuck@aeroastro.com

Thanks in advance.

CTCSS - Continuous Tone Codes Squelch System:
(A.K.A. "PL Tone")
Encoding: This lets your radio key-up repeaters that requires sub-audible
tones for access. Reasons for "PL-ed" repeaters include private repeaters,
and interference reduction in congested areas.

Decoding: Allows your radio's audio output to turn on only if the desired PL
Tone is received. Some radios implement a paging feature using this. Not
nearly as important as encoding.

Front End Interference Rejection:
This determines how well your radio will receive signals in the presence of
strong nearby signals. If you are going to operate in a high signal strengh
environment, or you are in a congested area, having poor interference
rejection can render your radio useless. How important it is depends on your
local conditions and your intended usage. Better rejection costs more money.

SSB:
2 meter radios come in two basic flavors, "FM-only" and "all-mode".
All HT's and most mobile rigs are FM-only.
All-mode rigs include FM as well as SSB and CW modes. These rigs are much
more expensive. The SSB and CW modes allow you to do weak-signal work
(E-Skip, meteor, satellite) that is largly unfeasable with an FM-only rig.
(Yes there are some FM satellites, I know.)

SWR:
Seems that all hams should know this one. It measures how well your antenna
system is matched to your rig. High SWR indicates an inefficient antenna
system, as well as making life stressful for your rig's transmitter amplifier.
Many modern rigs will reduce their output power when a high SWR is detected,
to protect themselves from damage.

Hope this helps...

> Regards, TOM BLACKWELL, N5GAR, PO Box 25403, Dallas, Texas 75225

It's kind of hard to follow the instructions carefully. There aren't
any. The SB-200 manual states "The coils in the input networks are
factory aligned and require no further adjustment." Nice to know, but
mine needed adjustment anyway. By the way, the coils to adjust are:
80m-L5, 40m-L4, 20m-L3, 15m-L2, and 10m-L1.

xx>73, John, K1FWF

xxI must agree on their poor QC and soldering. It's not limited
xxto just soldering, however. I have found that they forget to
xxtighten hardware, all too frequently. Nothing worse than
xxhaving a #6-32 hex nut jammed into the blades of a tuning cap
xxin a 3 KW transmatch! Talk about sparks flying!

xxI still buy MFJ equipment, because once you've looked it over
xxinternally and done their QC for them (!) their stuff usually
xxperforms well and lasts for years. It's just a pain in the
xxneck to have to worry about having something wrong with the
xxitem right out of the box. -YMMV-

xx73 de KC5NG

xxPS: I've spoken to Martin F. Jue (owner and founder) at a
xx hamfest about this problem, and he acknowledged that a
xx problem exists, and that they are trying to get their
xx act together.

I had that exact same thing happen to my 3kw tuner. They forgot to
tighten the nuts on the ends of the cap's. I didn't have it floating
around, but I had open circuits raising hell with my solid state
finals! Now the unit won't tune at all.

Just a note!

I have been having wonderful luck with the ray-o-vac rechargeable alkeline batteries. They stay charged until you need them, the charger is cheep, they last a long time in service and recover after use like regular alkelines. If you run out of battery when you are out you go get aa couple of packages of new ones and then you have some more reserves. I have between 30 and 60 charges on several sets and they are still going strong. They are also great in walkman devices.

I take my Yaesu 470 with me when I walk about an hour a day five times a week. I get just about a week of use between charges. ni cads required charging every day to make the hour walk.

Regarding the MC 60 Kenwwod microphone, this unit is very VERY sensitive to external RF fields. It is no wonder than you are more sucessful with the hand microphone. Grounding is a good answer but even with the introduction of multiple ferrite beads and bypasses, the amplifier portion continues to produce distortion due to RF. One answer that worked was to be SURE that the metal head is connected to the flex cable of the microphone. In my case it was not! Cliff Buttschardt W6HDO

Source record: 206734

The FT-10 and the FT-40 both have SMA connectors, although the
opposite gender of what you are used to. Yaesu makes an adapter called
the CN-2
that converts to standard BNC for use with outside or other antennae. It

does have a shield connection, and is standard 50 ohm output.
By the way, the DVR is very handy for using the radio as a wireless
answering machine. You can leave an outgoing message for someone in
the paging mode with a CW id, and they can record a message for you to
retrieve when you get free. Pretty sharp!

[Tom, W8JI, made a parallel comment in regard to the IC-706 in particular.]

I only expressed the hope that the firmware was in a socket mounted device
versus an SMD or other soldered package, which would allow owners to
install ICOM provided upgrades at home. The use of either a reprogramable
device or one with its data and code externally readable was not on my
mind at the time.

Hello everybody,

Does anybody know if I can use an Icom 706 in FSK with a narrow (i.e. the
500 HZ CW IF filter) without any modifications on the radio???
I want to operate PACTOR, G-TOR etc using a narrow crystal filter.
Also which filter does it pick-up when in FSK mode???
I have not got this radio yet, but I want to find out from existing users
if it can do these things first.
Thanks in advance.

From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <DLrJEu.5np@avalon.chinalake.navy.mil>
Source record: 206745

Almost everyone has this problem with MC-60 and MC-85 mics. Try running an external ground wire form the MC-60 base plate to the station ground. Do not use the pre amp. Try some radio shack ferrites between mic and the base. Make sure allthe cables are tight.

These are the things done by those who went before you. I also like to go under the base and bypass the power line with a small ceramic cap to ground.

Good luck,

```

>the narrow CW filters be engaged. Any other comments on this
>rig would be appreciated.

Hi Stu, I have both of the optional 500 Hz filters in my 245. They show up as the selected filters in FSK when "narrow" is selected. Only "narrow" and "wide" are functional in FSK in my rig and I don't recall what filters are selected in "wide". The digital modes are my principle interest and the 245s 500 Hz filters are superb at 170-200 Hz shift FSK. The AGC is so powerful and fast that it is fully up to the task of monitoring both sides of ARQ QSOs with more than 9 S-units of signal strength difference! Using an AFSK Mark tone of 2125, the dial reads true Mark/Carrier frequency. It's a great rig for digital modes.

Good ones! A few suggested additions:

"It was working when I removed it from service." (Translation: I unplugged it before it could actually set my hamshack on fire.)

"You should be able to find replacement tubes with no trouble at all." (Translation: They stopped making them in 1932.)

"This military gear is built like a tank." (Translation: It fell off the truck on the way here.)

"This is a classic rig." (Translation: I paid way too much for it, and now I want you to bail me out.)

"That's a fair price for this computer." (Translation: That's what I paid for it 6 years ago.)

"Sorry, cash only. No checks." (Translation: It doesn't work.)

"I guarantee it will work fine." (Translation: I'm not in the callbook).

Cheers...

Mike "total hamfest junkie", N4PDY

<snip>
Michael (and everybody else too),
I never said anything about charging cells in the alkaline cell holder,
just using secondary cells in the FBA-14 with charging out of the pack.
Someone else inserted charging an FBA-14 pack into the thread. I
don't believe that it is possible with the FBA-14 anyway without ill
advised hacking as the only exposed contacts art the ones that bypass
the cells and go straight to the radio. My initial question about
non-obvious short circuit problems with the pack or radio has been
answered fully, and I agree 100% with your comments about improper
charging of both primary and secondary cells. Thanks for the info to
those who answered the original question, and please let's let this
thread die.

1290. SVETLANA: RUSSIAN 572B's *an opinion*

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-26 00:00:00 UTC
From: gary <design@thereporter.com>
Message-ID: <4e9tah$odr@miwok.nbn.com>
Source record: 206752

A week or so ago, I requested info on the Russian 572B amplifier tubes. Getting no response, I downloaded the spec sheet on these tubes from the Svetlana internet page, www.svetlana.com, and cheched it out. I ended up buying a set of 4 from Antique Electronic Supply, since they were cheaper than R.F. Parts, and received the tubes yesterday. I might mention that ALL the places I called about foreign 572B's STRONGLY recommended AGAINST the Asian made tubes (even though they were selling them!), and equally strongly recommended the Svetlana tubes.
My Clipperton L amp has original, perfect condition finals - output over 1500 watts on the lower bands. I plugged in the new Svetlana 572B's, and found that they had IDENTICAL performance to my existing 572/T160 finals. I have no way of guessing how well the Russian tubes will stand up in the long term, but their physical construction is very adequate, they are physically slightly smaller overall than "domestic" 572's. Antique Electronics charges $2 matching fee for matched sets - *MUCH* less than RF parts, and mine appear to be quite well matched - all 4 tubes show equal color under load. I paid $67 apiece for the tubes, plus $2 each matching fee, and of course as a California resident, avoided state tax since they came from Arizona.
I am totally satisfied.

1291. Re: Connector Insertion Loss

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-26 00:00:00 UTC
From: rst-engr@oro.net
Message-ID: <4ebd93$hpg@hg.oro.net>
Source record: 206753

>If the PL259 is propperly installed, it will have negligible
>loss on VHF.
Excuse me? The PL259/SO239 is a non-constant impedance connector. That is, nobody guarantees that the ratio of center pin diameter to external shell diameter is 50 ohms. By my eyeball, you have roughly 2" (5 cm) or so of noncontrolled impedance in the middle of a 50 ohm line, or about 10 degrees of wavelength at 2 meters. Anybody that says you can piddle around with that kind of mismatch without problems hasn't fought mismatch gremlins on the bench in a while.

> Henry Radio istalls them internally in the output of a
>KW-amplifier at 144 and there are no problems.
Henry Radio does a lot of things that are a tradeoff between best engineering practice and commercial expedience. Not knocking them -- I've used RCA connectors at VHF because it was much cheaper and the loss really didn't make a lot of difference. The art is in knowing when you can get away with it and when you can't. Throwing away a few watts out of a kilowatt to mismatch isn't a big deal. Throwing away a couple of dB is anathema when you are working in the noise of the system.

>BNC is not a good option, unless cable lengths are very short
>(a few feet only)
Where in the hell is THAT written? Look at some of the lower VHF frequency professional test gear and tell me what kind of connector that is on the front panel.

> and you can use RG59 type cable.
In a 50 ohm environment you recommend 70 ohm cable? C'mon.

> A BNC connector with RG213 is mechanically not a good idea.
Neither is carrying ten tons of bricks in a Honda. BNC wasn't intended for use with RG-213 (or RG/8 as it was formerly known). If you are going to use 213, then the N-connector at VHF is the series of choice. BNC was intended for RG-58 and with adapters, RG-214. If you want to use BNC and 213, then I recommend N-BNC between-series adapters.

>The loss in a PL259
>becomes of course prohibitive on any frequency, if corroded.
and since it isn't weather-tight like BNC or N, it will corrode quite nicely in time, thank you.

TS 403 and matching PS 430 for sale. Up to 200 watts transmit. Excellent general coverage receiver 100 kHz to 30 Mhz. No mike. Have operating manuals. Sell as package only. $675 and I'll split cost of UPS shipping.

1296. FT-51R Extended RX Range Problem...(?)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-27 00:00:00 UTC
From: assst5+@pitt.edu
Message-ID: <4ec1if$gqc@usenet.srv.cis.pitt.edu>
Source record: 206586

Thanks to all who responded to my queries on FT-51R feedback; I picked one up the other day and I love it!

However, I have a question re:the extended RX range and channel memories.

I like the fact that the extended RX range is not always enabled; I thought that I could possibly avoid some intermod by not enabling the extended RX range when I wasn't utilizing it. Today though, I wanted to see if I could pick up anything on the aviation band, so I did the little start-up procedure described on pg.61 in the manual to put it into extended RX mode. Fine. (and I was able to find an aircraft channel!) anyway...

Later I disabled the extended RX range and found that all of my channel memories and other stored setups (dial xfer, etc) were gone! It was as if it was restored to factory settings.

(1) Has anyone else experienced this prob?
(2) Should I just leave it in extended RX (in other words, are my intermod concerns justified) ?
(3) Or is there a way to preserve the settings?

Thanks for any help!

Unfortunately most amateur rigs are wide band, Commercial rigs like G.E. and Motorola have helicals in the front end and only
have a usable band width of 2-4 Mhz. It hard to have our cake and eat it too.

Hello!

I have come by an old Hallicrafters sr-160. I am a tech no-code, and am thinking about upgrading. I don't know what to do with it. My dad, K3IXI QTH Columbus, Ohio has a BIG problem 'loading' the dipole antenna (which I know for a fact is good)... could be the amp tubes. Should I try to sell it or have someone fix it?? It's all analog in there!! The nostalgic value could be very high for a lucky buyer. Comes with amp-unit, tuning unit and great looking PTT Mike. Will take highest offer, or good reccomendation re: where to get someone to fix the dang thing.

I am in the Cincinnati-Northern KY area. I'd love any responses I can get! personal e-mail preferred.
Thanks... 73

Cool! I use DTMF paging here in Salt Lake. That would be a nice extension.
Yaesu marketing should figure out how to better describe features in their
advertisements; their ad (and literature in reply to my request) left me
wondering what the DVR really does. Can it also be used "manually" to
record audio, e.g. as received, and then play it back while transmitting?
That would be a nice way to convey a signal report back to someone,
as some repeater controllers can do.

Has anyone heard when a similar dual-band radio will be out --
a model FT-50R as one would expect? Hope so.

>...I used it at -10F...

Wonder if you used lithium batteries.

Actually the dashes are reduced the same amount. And the problem becomes more noticable at higher speeds.

But this problem is certainly one of perception Steve! What sounds like acceptable weight reduction to me may drive you up the wall, and what sounds awful to me may make someone else happy as a cat eating dead rotting rats.

It would help if all keyers had weight adjustments. It would help if designers should carefully add the precise amount on the trailing RF waveform edge as they delay the leading RF edge. In other words, if they delay the start 13 mS to allow circuits time to settle, the trailing edge has to be extended 13 mS.....NO more--and NO less, and no exceptions.

Trust me, a lot of the newer radios and keyers have this problem. Probably because the engineers don't know CW from their........ahhhhh...feet.

Anyway, let's be fair. Let's wait and see what they come up with. The engineering people in Japan may not even understand the problem yet.
;-)

Hi:
I have a Kenwood TS-830s which is currently using the 6146B Finals, but have the chance to get some 6146W's, at a cheap price. Has anyone had any chance to use the 6146W, and is their any mods that have to be done before using them or is it just drop them in and Neutralize and go. They are made by General Electric if that helps out any. Any info on this matter would be greatly appreciated. Thanks.

>757GXII HF transceivers? I was told not much except the name was
>changed every few years it was being made. Is this true?
>

The radio started as the 757GX.

It was a good radio, with an OK receiver and lots of features std.
It had a few drawbacks (if you can call them that):

Only 8 memories
No "Fast" tuning mode, although there was a 500 kHz up/dn button
This could lead to spin, spin, spin...and the encoder could fail
after a while
A change in mode required the use of a switch, so the mode
wasn't saved in the memory info

The 757GXII came out around 1989, and included electronic mode
switching (AM > FM > CW > CW-n > USB > LSB) via a single switch.

The mode was stored in memory.
The number of memories was increased to 10.
A fust tuning mode (with button) was implemented.
The case color was changed to a more dark-gray color.
The display became more gray as opposed to the previous
bluish color.

The receiver was identical, and the radios were very similar.
Hope this helps.

Hi,

I file about three to four TA's a year with the FCC, and my most recent conversation with the fellow that does the FCC amateur TA was yesterday. As of yesterday, the rules were the same as last year and the year before, etc. There are NO plans to drop part 97 TA requirements. The only relaxed reviews will be on part 15 devices. Review of part 15 devices may be reduced, but the LAWS will all still apply. So, if you sell and declare complience and flunk with your part 15 device, you are in the soup.

In article <4e5ch8$j5n@cville-srv.wam.umd.edu>, ham@w3eax.umd.edu (Scott Rosenfeld NF3I) writes:

>As I understand it, the problem with 6m amps is that external
>amplifiers for 6m must be type accepted and sold only upon
>proof of license if PROFIT is to be made.

Part 97 rules do not consider "profit".

> In other words, it sounds as if one can sell them at cost at will, but is not allowed
>to make a profit.

If you the regulated devices all day long at a loss, they still must be type accepted.

>This process of getting type acceptance apparently costs roughly $3k,
>making a profit earned from sales of such an item risky at best,
>depending on your markup.

Type acceptance costs only a few hundred dollars in fees.

>On another, parallel note:

>I've ALSO heard that since the FCC really doesn't care about
>the combination of the amateur service and type-acceptance anymore,
>it is generally acceptable to sell such amps as the FCC has turned
>away from the issue.

That's absolutely untrue. The regulations are the same as they have been. If the device is covered, it must be type accepted. If someone at the enforcement branch notices you, you may wind up in some very "hot" water.

>So is Ten-Tec following the rules? Yes. You cannot sell 6m amps
>without going through the $3,000 type acceptance process. At $60
>for the kit, they're probably making $10 profit (really - they say
>that they make very little on the 6m xverters, and as one who has
>built one for $95, I believe them).

Kits are exempted from type acceptance under the condition they are parts only, with no assembly instructions. It is legal to supply a "parts kit" that includes components and a schematic, but if additional assistance is made available it becomes a "amplifier kit". An amplifier kit must be type accepted. This is absolutely true even if you give the kits away at no charge, or pay people to take one!!!

>Taking the laws too seriously? When you're a large company that has
>existing gov't contracts for expensive HF receivers, I don't think so.

The law is the law. Some things slip by, but if someone gets caught.....it can be sticky.

The Euro filters are narrower to accomodate the shorter first
adjacent spacing they allow. You may experience slight distortion
on transient peaks when listening to heavily processed US stations
(but who would notice given the heavy processing?). I wouldn't worry
about it.

Actually, many radio manufacturers and antenna manufacturers use
PL259/SO239 connectors on their equipment. The trick is to take
the transmission line segment behavior into account in the unit's
output or input network design, IE this short transmission line
transformer becomes part of the input or output impedance matching
network. The only place you can run into trouble is if you use UHF
connectors with inline splices. Then there will be a discontinuity,
and no network in which to absorb it.

>>BNC is not a good option, unless cable lengths are very short
>>(a few feet only)
>Where in the hell is THAT written? Look at some of the lower VHF
>frequency professional test gear and tell me what kind of connector
>that is on the front panel.

Right. There's no electrical difference between N, BNC, or TNC.
The only differences are mechanical.

>> and you can use RG59 type cable.
>In a 50 ohm environment you recommend 70 ohm cable? C'mon.

Don't jump so quick here. There *are* BNC connectors specifically
for 75 ohm cable. We use tons of them in TV broadcast plants. We're

especially sensitive to impedance discontinuities in broadcast
because reflections cause ghosts in the picture. So we use 75 ohm
BNC connectors on 75 ohm cable.

>> A BNC connector with RG213 is mechanically not a good idea.
>Neither is carrying ten tons of bricks in a Honda. BNC wasn't
>intended for use with RG-213 (or RG/8 as it was formerly known). If

>choice. BNC was intended for RG-58 and with adapters, RG-214. If you
>want to use BNC and 213, then I recommend N-BNC between-series
>adapters.

Actually, a BNC connector is rated for the same power handling as
a type N connector. The center pin is the same diameter, and the
fingers that make shield electrical contact are the same diameter.
The only difference is the mechanical coupling, and the larger
thermal mass of the N fitting. Correct BNC connectors are made
for RG-213 type cable, and are far superior to using adaptors.

The bayonet coupling is less strong than the screw coupling,
but either is typically stronger than the cable. I've demonstrated
this by swinging my full weight from either style. An Amphenol
style connector of either type will fail by braid separation
before the mechanical joining will part. A proper Kings crimp
connector will not fail by braid separation, but the smaller
cables will stretch to uselessness under my weight.

Typically when one of our remote truck drivers pulls off from
a site without disconnecting cabling, the connectors will
still be attached to the feedthru bulkhead when he arrives
back at base. The cable will have parted instead.

>>The loss in a PL259
>>becomes of course prohibitive on any frequency, if corroded.
>and since it isn't weather-tight like BNC or N, it will corrode quite
>nicely in time, thank you.

Neither are BNC or N connectors weatherproof. Any of them used
outdoors require additional weatherproofing steps to allow them
to survive. The PL259 actually has a slight edge here because
the larger surface area of the inner means it can tolerate more
corrosion before the connection is seriously degraded.

>How far is too far for typical HF work? 1/4 wavelength?

A 1/4-wave is worthless as an RF Earth ground feeder. Such stubs are routinely used for RF *isolation* from mounting structures.

>I've seen this mentioned here a few times., but I've wondered what the max
>distance is. My options are, a wire through the floor to the basement to a
>water pipe. > 20 feet.
>Or a wire out the window to a ground rod, around 8-10 feet.

The latter is about 1/4-wave at 10 meters, thus worthless, and the former is even more hopeless. An effective RF earth ground feeder longer than 0.1 wavelength is too long. Even that's pushing it, 0.01 wavelength is a better upper limit. For lengthy earth connection ground feeders to be effective for RF, they have to be made resonant multiples of a halfwave. That offers a low impedance path. Use of multiples of 1/4-wave will result in a high impedance path. Use of lengths in between will present some intermediate value of reactance.

Fortunately, there is almost never a reason to have a low impedance RF Earth connection directly to station equipment, so this is all rather moot. For *unbalanced* antennas, an Earth connection is required *at the antenna feedpoint*, or some electrical equivalent counterpoise can be used. For balanced antennas, no RF connection to Earth is required at all.

An Earth connection is required for electrical safety, but that's for DC and 60 Hz AC, so any reasonable length is fine. Protective grounding for lightning protection is another topic. Lightning must be offered a low impedance path to Earth, but you generally *don't* want your station equipment to be part of that path. That's why you want to *isolate* your equipment from that path by using ground window technique. You provide lightning with a low impedance path from where it strikes to where it goes to Earth somewhere *outside* your ground window (or at your ground window if it is close enough to Earth). The latter is a really good idea, swinging overhead feeders into your station can be an invitation to disaster. Bring them down to Earth where they can be suppressed before allowing them to enter your station.

>Use of large (>1" wide) flat braid out the window to a ground rod may help
>in your situation. The braid will have less inductance.

Braid is bad. It will have *more* inductance and more skin resistance
than smooth flat strap. Braid should be used only when the conductor
must flex, otherwise use solid smooth flat strap (roofing flashing
copper is good). And, obviously, no sharp bends should be allowed in
the conductor.

The reasons should be obvious. Since braid is woven, it offers more
inductance than a straight conductor. And because of skin effect,
the currents will be forced to jump from strand to strand across
the loose mechanical weave as each braid strand dives in turn into
the weave while skin effect is forcing the currents to stay on the
outside of the braid.

That, incidentally, is why flexible coax has more loss than hardline.

You people on this network obviously know what you'e
doing - so HELP!
I'm running a research projec in rainforest in Indonesia
and we're using 14.4khz (or something) hand held radios
but they have a pretty short range ad we need a base
station (well, two actually) capable of reaching
70 plus miles and coping with some BIG mountains between
base camp (forest) and base (town)
f somebody out there could advise of what might
work - and not break out bank balance - ideally,
any system would be on a two metre band so we can
talk to the national park in emergency.
Any suggestions gratefully received!

>line, or about 10 degrees of wavelength at 2 meters. Anybody that
>says you can piddle around with that kind of mismatch without problems
>hasn't fought mismatch gremlins on the bench in a while.

The samples I tested last year measured in the mid twenty to upper 30 ohm range, and the bump is only about 1/2 inch long, not two inches. The impedance problem is in the area of the SO-239 where it slips over the male pin. The 259 is great up to the pin itself, and the 239 is a pretty good also. So the bump is pretty short.

At 144 MHz a 259/239 junction doesn't upset things very much. On an HP-4191A analyzer I measured an average change of SWR from a perfect termination of 1:1 with no connector to less than 1.2 to one with a single 259/239 junction. That was with minimum line length in the connector test. Of course a longer line with some attenuation will dilute the SWR change even more.

The biggest ill effect came from omitting the hood from the SO-239 and not grounding the braid correctly.

A UHF connector system is fine on two meters if the connectors are installed properly and reasonable quality standard parts. Even for flea power. Connectors do not reduce power on a fixed wattage basis, they work by dB loss. At a kilowatt or only one watt the loss is insignificant below a few hundred MHz.

>because the engineers don't know CW from their........ahhhhh...feet.

This *shouldn't* be a problem, even to non-Morse operators. The timing relationships of Morse are well defined. The basic unit of timing is the dot, all dot intervals must be precisely the same for any given sending speed, and all other timing elements must be exact integer multiples of the basic dot duration. What could be simpler? Perhaps the engineers are confused by the ARRL advocating use of Farnsworth Code instead of Morse Code. Perhaps they think Americans *like* their dots shorter than the WPM timing would require.

1334. Heath HW101 Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-27 00:00:00 UTC
From: TJB94002@UConnVM.UConn.Edu
Message-ID: <1771BA645S86.TJB94002@UConnVM.UConn.Edu>
Source record: 206624

I just paid $200 for an HW101 Heath transceiver. I expect to listen until
I get my ticket then be able to transmit. I have the following questions;
1. Was $200 a good price?
2. Any comments in general about the unit? Anything I need to look out for?
3. I went through the alignments but can't seem to get the VFO dial to center.
Its calibrated but the 500KHZ line is right at the hard stop. Any comments?
4. There is about 2KHZ backlash in the VFO drive. What can I expect? Is there
any information out there about Jackson drives? Who made them? Are there any
comments about reducing or eliminating the backlash?
5. Are there any receiver mods out there?
6. Are there any simple 160m to 80m converters out there?
Thanks.

1335. Manuals: EICO324, Heath GR-81

Stan-

The plug you are looking for is a black phenolic plug with 2 metal pins that fit the female jack on the Drake power supply.

I assume the plugs may still be available from Drake (ask for Bill Frost or his successor in the Drake parts department [Miamesburg, Ohio].

I have several of these plugs but am not anxious to part with them as every once in a while I use them when I work on Drake gear.

I could probably give you a photocopy of the plug if that would help you to know what your looking for. In a pinch, you can take pin off an old octel tube base or Amphenol adapter plug and solder then to the end of your control cable... or even tin the wires well and insert them into the the jack. I've done the later at times with great success.

Good Luck!/ Alan, W3VL

>73.

I have had a 2700 for a while now. I think it is a piece of junk for the price paid. I agree with the above comments. I sent it in to ICOM when I first hooked it up and they said everything checked out OK. BUT it is extremely sensitive to intermod. I have compared to my IC 3230H and several W2A HTs hooked into the same mobile antenna system. The 2700 just does not cut the mustard.

There is a mod to increase VHF receive range. They did it for me when I sent it in. It has something to do with jumpers. Maybe someone else out there knows about it.

Right now I would rather have another 3230 than the 2700. Unfortunately, I spent the money to get it new, and I would get hosed in a trade.

1345. Wanted Info on Ten-Tec HF Rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-27 00:00:00 UTC
From: "BICC Info. Center" <W236@ohsu.edu>
Message-ID: <4edsut$8r@fremont.ohsu.edu>
Source record: 206635

I am a returning ham who is looking to set up an CW/SSB voice HF station. I posted a message earlier discussing the merits of an IC-706 for a begining ham and got a very mixed review. However, many people thought that the Ten-Tec line was rather good in many ways. There was some comment on the internal construction techniques used by Ten-Tec but overall most statements where favorable. What I need to know from some wise old elmer or just anyone with experince with Ten-Tec gear is what is their best used rig. I know absolutely nothing about the line other than seeing their ad in QST for the Omni-VI. I would prefer general coverage and digital tuning but that's not essential. What I do want to stay with is solid state gear due to my difficultly with obtaining tubes and servicing tube gear. If someone could E-mail me some info or point me to a book or article I would be very pleased. I have difficulty accessing this newsgroup on a regular basis from my network connection therefore, a direct E-mail would reach me much sooner thanks.

Thanks
Brad WB7TSO

1347. Help: Amplifier Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-27 00:00:00 UTC
From: "Michael A. Seagroves" <mseagrov@ic.net>
Message-ID: <310A82F3.13C3@ic.net>
Source record: 206637

I have a

TPL Communication
VHF Power Amplifier
90w out 10w in
13.8 vdc
P/N 3-1 DE
Serial # 0225

On the front of the amp is a stereo phone jack labelled power control

Could someone please tell me what this does and how does it work.

Tip- red wire to circuit board
Ring- white wire to circuit board
Sleeve- black wire to circuit ground

Where might I found a manual or a schematic diagram.

Thanks

Mike KB8MMS

hat radio >could not receive the weather etc. So I bought the PAC Electronics notch >filter for the Paging frequencies that are adve=
rtised in QST, ham trader >and CQ for $68.

Here is the company information:

From the ADDRESS.ADB TIS database (1996 ARRL Handbook disk):

PAR Electronics
6869 Bayshore Drive
Lantana, FL 33462
USA

Phone: 407-586-8278
Fax: 407-582-1234

Products/Services: FILTER-NOTCH FILTER, FILTER-INTERMOD FILTER

Notes: VHF Filters for intermod rejection.

Date of last change: March 7, 1995

The PAR filter is a notch filter. It has low insertion loss, but is
only good to eliminate interference from 152-156 MHz pagers, etc.

Mike, I DID have an FM-27B and it was nothing like ANY other radio. Certainly NOT the 13-510. The 13-510 was a PLL synthesized radio, much the same technology used in the radios of today, except without the microprocessor.

The FM-27B on the other hand, was of a technology called a "Crystalplexor" which used several crystal oscillators combined with a single vfo to tune the frequency of the radio. That, coupled with poor filtering, is why the FM-27B became known as the 'WAN' or Worked All Neighbors radio. Looking at it's output on a spectrum analyzer made you think you were at the Dayton Hamvention looking at the two meter band with a gain antenna. :)

I wouldn't reccommend putting this radio back in service, unless you live in a very rural area, far from any population center. Otherwise, you will soon find yourself the recipient of numerous interference complaints from people both in and outside of the ham bands. Whatever you do, DO NOT use an amplifier after this radio! It will amplify not only your desired signal, but all the spurious ones as well, dividing it's total RF output among them in proportion to their amplitude and proximity to the center frequency the amplifier is tuned to. I've seen spurs coming out of one of these radios that were LESS than 10 dB down from the disired carrier frequency. With the nominal 25 watt output of the barefoot 27B, that would be at a power level greater than 2.5 watts! More than enough to drive an amplifier with 8 dB of gain to over 15 watts!

The radio does, however, make a nice doorstop, conversation piece, or bargain basement spare receiver. Just be very careful transmitting with it.

73's and G.L.

>no-less. Comments or confirmations????

Well for sure you don't want to refill the battery with HCL.
When you go to charge it, it will liberate chlorine gas. The
proper acid is H2SO4. The phosphoric acid in Coke might remove
a surface sulfide coat on the cell plates that was making the
battery high impedance, but I'd be worried about all the sugar.
When you refilled with H2SO4 you'd get a violent exothermic
reaction.

From: Bob Smith <rsmith@internetmci.com>
Message-ID: <310C0F0F.5D5A@internetmci.com>
Source record: 206507

Got an Icom 737 and am a Mars op (NNN0SZD). We have regular nets on 3.349 and I can see the power output from my internal tuner hit 100% indicating a tune but cuts off. Icom told me it is part of the programming to not tune out of the ham bands.

Anyone know of a hack that may fix this? I really hate having to use an outboard tuner if I don't have to.

Also - I was told that this limitation does not exist with their outboard tuners such as the AT160 etc. Can anyone confirm this? Plus do the later rigs 737A, 738, or 736 allow our of band tuning?

Thanks ever so much.

Hi Everyone-

Does anyone know the source of an HF mobile antenna called the "Band-Hopper"?

It is a modified "screwdriver" design which has a built-in tuning mechanism to raise and lower the antenna based on transmit frequency. (This is what I was told from someone who has seen one.)

I believe that they are made in Montana?

Any information would be greatly appreciated!

Thanks in advance!

Source record: 206518

> anyone have any comments on dsp filters?
> how good do they work,will it really help out on heavy qrn say on 80 meters

A lot depends on how much you want to spend on one. My personal opinion
is that the DSP-59+ from Timewave is the very best for flexibility and
performance on CW/RTTY/Digital modes and does a respectable job
on noise reduction. The JPS NIR-12 does an ASTOUNDING job of noise
reduction and digging signals very close to the noise level out to make
them readable. It outshines anything else I've tried in this regard,
but I don't find it as clean and friendly on the non-voice modes as the
DSP-59+.

So, if you're primarily a CW and Keyboard type -- I'd recommend
a DSP-59+ or perhaps a 9+. The 9+ is still good, but a little less
comprehensive on filters.

If you're mainly interested in cleaning up band noise, none of the
LMS or adaptive correlation-based boxes (Timewave, W9GR, MFJ) can touch
the capability of the NIR-12 in noise reduction.

I have two of these things, one in the ORIGINAL box (no joke)!

I plan to keep one, and sell the other. They're in very good shape, and have FIVE trimmer caps internally, a large number of coils, and an SO-239 on each end. They're model LF-601A, about 14" long and 2x2" square. All aluminum construction, made like a tank. Please help!

THe pattern goes:

INPUT SO-239
Var. Impedance cap.
2-3-4 cap. (channels 2-4, I've been told)
4-5-6 cap. (channels 4-6, I've been told)
Var. Impedance cap.
Var. Impedance cap.
Output SO-239

On one of them, there are pieces of tape that someone has written on:

54 MHz 55.25 MHz 67.25 MHz 89 MHz 54 MHz

Were I to have a network analyzer, I could figger out how to tune...
I could really use a 6m LPF...

Listen to the transmitted signal in another receiver first in qsk mode
then in semi bk-in. Hear the vast difference. This is not perception or
preference! There should be NO difference. There is no difference when I
do this test with the Kenwood TS940. There is a difference when done with
the Yeasu FT-1000 and most Yeasu products.

Todd Little wrote :
>
> Our local village has offered our RACES group some old mobile
> radios that they no longer need. I'm guessing they are on
> either the public works or police frequencies here (around
> 151 MHz). Can anyone help me identify the type of radio
> and its options? The model numbers (which I understand
> also include option information) are:
>
> U33BBA1000A
> U33BBA1900A
> U43CMT1100A
> T43MHT1190B
> T73MHT4190A
> T43RTN1190B

The models are :

U33BBA1000A MO-COM 70 VHF 30 watt carrier squelch
U33BBA1900A MO-COM 70 VHF 30 watt
U43CMT1100A ??? 35-45 watt, carrier squelch
T43MHT1190B MOTRAC VHF 4 frequency 40 watt
T73MHT4190A MOTRAC VHF 4 frequency 110 watt PL
T43RTN1190B MICOR VHF 4 frequency 45 watt PL

A general rule of thumb for Motorola Models Numbers are :

1st digit = Usually a "T" or "U"

2nd digit = Usually Power Level
"0" = 2 watt
"2" = 6 - 10 watt
"3" = 25 watt
"4" = 35 - 45 watt
"5" = 55 - 60 watt
"6" = 90 watt
"7" = 100 - 110 watt
"8" = 110 watt

3rd digit = Band
"1" = 25 to 50 mhz
"2" = 66 to 88 mhz
"3" = 150 to 174 mhz
"4" = 406 to 512 mhz
"5" = 800 mhz

4th to 6th= Model of radio; MO-COM = BBA
MOTRAC = MHT or LHT
MICOR = RTN
etc

Remaining digits indicate number of channels and type of squelch

Hope this has helped.

Clark,

Deep cycle batteries are frequently made of lead-antimony while car batteries are (at least the low maintenance ones) made of lead-calcium. The difference is that you need a lower charging voltage to avoid overcharging the battery while floating. It is really tough to find a charger suitable for this use, but I finally did. The Exide Nautilus Gold charger (I bought mine at K Mart) has a switch to allow charging gel cells, which need the same charging voltage as lead antimony, along with lead calcium types.

Now I float my battery without worry about drying it out through overcharge.

Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

Well its happened.We the club members of the 82 repeater in Kansas City are dam mad.We didnt get
to vote and we didnt get to talk before the board decided to shut down the repeater between the hours
of 11 pm and 5:30 am.
There is over 600 members and these member are told that they can use the repeater because of one
person that misuses the repeater.This person has made it a living hell for all of us.So the club does this
and thinks that members will just say ok.On top of that the FCC is no help at all.They dont give a dam if
ham radio looks and sound like the cb band.And the old timers just say"Nocodes are the problem"
Well I give up.I dont know what to do anymore.I wonder why I got my ticket.And as I see it the hole
hobby is going down the drain.Im going to just call the ham band the chicken band radio.
And to Rick and all of the people that act like Rick.I hope that you are happy with what you did to the
82 repeat in Kansas City.
To the FCC I think that they should fire the lot and close the door.They are worthless.

Please do not reply back because I just dont give a care anymore.....

For the rest of you out there that love ham radio,I wish you good luck.

I don't think you are going to find any better intermod performance by disabling the extended receive range. I tried that and intermod was just as bad. My suggestion would be to leave it in extended receive all of the time if you want to listen to stuff out of band.

BTW*** If you are looking for something to cut down on intermod with the 51r, I can suggest something that is working great for me. It is a pager notch filter advertised in the QST classified pages..can't remeber the companies name off hand , but if you want more details email me and I can forward their address, etc. I use my 51 mobile with this filter and it was like I got a new radio! Areas in town where I couldn't even use the radio were now quiet with just the occasional "blip"..

73's and good luck,
Mike KS4DA

I believe you can leave in the filters; these are bandpass units, and no change should be needed at all; in fact I wouldn't even fool around with pre/de-emphasis as many US stations have gone from 75uS to 50uS as now permitted by FCC.
Except for input voltage, you shuldn't have to change anything.

Hello, Doug. I have an Icom 751 and used the FL 32 A? filter for a couple of years before finding the FL 52A. The combination of both filters is really great, and allow the pass band tuning which the FL 32 alone did not. The FL 32 alone was much better than the pass band tuning, a great improvement by itself. Maybe an alignment is needed in your rig. I also have a ts-850 with both if filters. The Icom 751 selectivity is on the same par as the 850, I'm reallynot sure which is better.

Another subject: I traded my Drake twins for an amplifier and still have lot of Drake parts if your friend is still interested. I have most all the tubes as well as three unused finals, an AC-3 supply, a mint speaker, and the T-4X carcass. The fellow who wanted it hasn't made it over from Houston to pick it up and may have lost interest.

Once you use one, you'll never want to be without. I built the
original one that appeared in September, 1992, QST. Whenever my HF rig
is on, so is the DSP. It makes it soooo much more comfortable to
listen without all the noise and heterodynes. Try it, you'll like
it...

On the 146.85 repeater here in Central NY we had trouble with one user also. He made it that
no one would even monitor the reapeater anymore. The club voted to ban him and we did. The reapeater is a great place to be again.

Diamond makes one but I forget the model number. I have one that I
used for 2M & 6M since a 2M 5/8wave antenna can be used as a 1/4wave
on 6M. The duplexer works on HF/2M/70CM.

Good Luck.

That's a weird story. The jerk behaves badly enough to be banned but is
obedient enough to obey your request that he voluntarily not transmit on
the legally licensed (input) frequency. Were there some strong words of
`encouragement' that went with the banning?

From: tegennett@hfs.purdue.edu
Message-ID: <NEWTNews.5806.822864248.Postmaster@hfs08>
Source record: 206686

Have written a logging program in Microsoft Access to log HF QSO's.

Got it doing pretty much want I want now with data manipulation. Ready to tackle rig control. Primary interest is in automatically logging frequency and mode with each QSO, rather than typing in each entry.

Rig is KNWD 450. Documentation that came with it provides commands and data exchange codes. Recommends using Basic or other programming language for rig control.

Anyone know if Access Basic, the programming language embedded in Access, can be used for this purpose? And can you recommend a text that can help me write the code? The documentation supplied with Access is pretty light on information about Access Basic commands, etc. Seems to assume the programmer has previous experience in one Basic dialect or another, which I don't.

Any advice will be greatly appreciated.

I would assume they would work well in reducing QRN on 80, although I haven't used one for exactly that purpose.

I have a Timewave DSP-9+, and have found it to be very useful for CW. The random noise reduction is dramatic, as well as the digital "agc" that it can apply. The only thing that is problematic is when I've tried to copy a CW signal within, say, 1.5KHz of a strong packet station. Without narrow filtering in the receiver before the AGC is derived, the strong signal causes the receiver gain to be reduced to the point that the CW signal drops out. And when it drops out (as far as the DSP is concerned) it drops completely out!

On SSB, the results of DSP seem to be less dramatic, although the noise reduction and "auto notch" capabiluty work quite well.

I'd like to echo Gary's sentiments. I too had a FM-27B, and what he
says is correct, though technically it didn't have a VFO, rather it
had multiple VXOs. The only dirtier rig I've owned was the Regency HR-2.
And at least it didn't drift, the Clegg did. It was certainly a novel
radio for its time, but not something I'd want to put back on the air
today.

Gary

Another item that prompted the GX II was the large number of GXs that had serious problems with the switching diodes (Also in their top of the line model the designation I can't remember right now). Many of the earlier production had to be sent back to Yahoo for repair and earned it a bad reputation on that model.

1420. 757GX Sideband Switch Mod? Anybody done it?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-28 00:00:00 UTC
From: "Michael G. Reiney" <mreiney@hevanet.com>
Message-ID: <4egj2f$5qo@vista.hevanet.com>
Source record: 206692

I have a Yaesu FT757GX on a remote base. The stupid thing uses a hard switch to select sidebands. Can't switch it by remote. And it doesn't auto-switch with band. Has anyone modded the thing to auto-select the proper sideband?

I thought about sticking a PAL reading in the mode switch and band to output proper sideband select. Problem is that the signal levels are 8 volts, GAL20V8 is 5 Volts. I could get the PAL shoehorned in, but no room for level shifters and voltage regulators.

Any ideas?
miker

1421. Info on Italian SWR meter?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-28 00:00:00 UTC
From: drranu@holly.ACNS.ColoState.EDU
Message-ID: <4egn5i$2rlq@yuma.ACNS.ColoState.EDU>

I picked a very nice SWR/Power meter at a swap fest recently.
It works really well, but I did not get a manual it for thus I
have no specs on it. If you happen to know any specs for this
guy, please pass on the information (freq, insertion loss,
max power, etc).

It says on the face "ZG; Zetagi, Italy; mod HP5000; HP series."

Thanks a lot!

1424. HELP! RS HTX-202 not CTCSSing!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-28 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4egrjb$jp6@cville-srv.wam.umd.edu>
Source record: 206696

I've got an HTX-202 that, apparently, has NEVER had a functioning CTCSS circuit (never really need before). I have the owner's manual and schematic, but no service manual and I can't positively ID the CTCSS IC...

If it's a bad solder joint or bad trace, that'd be great; if it's a dead IC or component, that'd be OK, too, so long as I could FIND it inside the radio.

Anyone have a service manual or just know what's responsible for generating and decoding the tones? Guide me, please!

Thank-you for reading this. My name is Michael Long (KB8WPE) and I am the Public Relations Manager for the Husky Amateur Radio Club (HARC) whose callsign is W8YY. The club is located on the Michigan Technological University campus.

Starting on February 1, 6am EST, and continuing on until February 3, 6am EST, W8YY will be running a Special Events station for Michigan Tech's Winter Carnival '96. The frequencies listed below are the most likely place we will be operating. For this Special Events station we have 8"x11" certificates that would look great on anyones' wall! All you have to do is contact us and then send a QSL with a self addressed stamped envelope to receive the certificate.

Here are the frequencies:

Band Frequency Mode Time
160m 1.90 MHz LSB 8pm-8am
75m 3.90 MHz LSB 10pm-8am
40m 7.25 MHz LSB 7pm-10pm
20m 14.250 MHz USB majority of the day (8am-7pm)
17m 18.150 MHz USB if open 8am-7pm
15m 21.350 MHz USB if open 8am-7pm
10m 28.40 MHz USB if open 8am-7pm
2m 144.2 MHz USB All the time
146.58 MHz FM All the time
70cm 432.100 MHz USB All the time

Again, thank-you for reading this message and all of us here hope to here from you during the Special Events station!

For any more info. email me at cmlong@mtu.edu or the Club President, Dave Gillahan, at dmgillah@mtu.edu

You can also check out our homepage at
http://techsrv1.tech.mtu.edu:8080/harc.html
Though it is just beginning it does have a little information on it.

Sincerely,
Mike Long -KB8WPE-

Continuous Tone Coded Squelch System - otherwise known as PL(tm) which was
Motorola's Private Line system. It's a way to limit access to repeaters and
or prevent interference from other stations that is non-intentional.
>
>Front end interference rejection

In other words - how much junk it'll let through. I do wish my FT-5100
was a little better in this department but being that I live between
numerous paging towers that's never going to happen.
>
>SSB (I assume means "single side band") as apposed to what?

Your assumption is correct. SSB is usefull for satellites and as another
method of communicating as opposed to FM (Or Phase Modulation). You'll
generally find this in multi-mode radios. Go for it - don't just get stuck
on 2m FM.
>
>SWR (I assume means "standing wave ratio") what does this tell me about
>antennas?

It tells you how much power is being reflected back to the radio. If you're
running 50W and 25W is coming back down the line to your radio there's a
problem.

>As I understand it, the problem with 6m amps is that external
>amplifiers for 6m must be type accepted and sold only upon
>proof of license if PROFIT is to be made. In other words, it
>sounds as if one can sell them at cost at will, but is not allowed
>to make a profit.

No. That's not what the rules say. There is no issue of profit or non-profit. Here's the relevant text of 97.315.

97.315 Type acceptance of external RF power amplifiers. - (a) No more than 1 unit of 1 model of an external RF power amplifier capable of operation below 144 MHz may be constructed or modified during any calendar year by an amateur operator for use at a station without a grant of type acceptance. No amplifier capable of operation below 144 MHz may be constructed or modified by a non-amateur operator without a grant of type acceptance from the FCC.

So an individual amateur can make 1 amplifier for his own use, but a manufacturer can't even make 1 without type acceptance. This rule applies to kits too. The way some unscrupulous companies get around this is to sell you the parts and the instructions *separately*. So they aren't technically selling you an amplifier kit. That's how the amplifiers derived from the Motorola application notes are sold.

>So is Ten-Tec following the rules? Yes. You cannot sell 6m amps
>without going through the $3,000 type acceptance process. At $60
>for the kit, they're probably making $10 profit (really - they say
>that they make very little on the 6m xverters, and as one who has

>300 kits just to BREAK EVEN.
>
>Taking the laws too seriously? When you're a large company that has
>existing gov't contracts for expensive HF receivers, I don't think so.

I agree. It's a financial decision. 6 meter amplifiers, and even 10 meter amplifiers, can receive type acceptance, but the criteria are so strict that few manufacturers want to bother.

>Hello everybody,
>
>Does anybody know if I can use an Icom 706 in FSK with a narrow (i.e. the
>500 HZ CW IF filter) without any modifications on the radio???

YES!! The 500 Hz filter works fine.

>I want to operate PACTOR, G-TOR etc using a narrow crystal filter.
>Also which filter does it pick-up when in FSK mode???

Unless you install an optional filter, it uses the default SSB filter.
When you install an optional filter, the NAR softkey becomes active
and you can switch it in line. The way the IFs are staggered for the
various modes, the narrow filter's passband will be right where it
is supposed to be for the standard RTTY/PACTOR/AMTOR tones when the
radio is in RTTY mode. When the radio is in CW mode, the filter passband
will be centered on 800 Hz, again just as you'd expect. Great feature.

>I have not got this radio yet, but I want to find out from existing users
>if it can do these things first.

I'm using mine on PACTOR and Clover. The 500 Hz filter is a *big*
help, recomended. You only get to install one optional filter, if
you're using digital modes, the 500 Hz filter is the one you want.
If you were a CW operator, the 250 Hz filter might serve you better,
and if you're exclusively a phone operator, there's an optional
narrow SSB filter you can install. When you install the filter,
you have to go into the setup menu and tell the radio which one
you installed so it can do the right things with it in the various
operating modes. It knows what the passband center is of each of
the optional filters, so it will shift the IF the proper amount
to place that passband center right where you need it for the
mode selected. The IF shift function works with all filters, so
you can fine tune the filter passband center with it if your
needs are unusual.

Not necessarily, witness the HTX202. Front end rejection and wide band
receive are almost mutually exclusive. So a marrow coverage radio can
offer both better intermod rejection and cost less. It is generally
true that for radios with equal tuning range, the one with better intermod
response will cost more, but you can't just take that for granted, some
very expensive radios have truly dismal intermod resistance.

>SWR:

Well, not quite. Read what I said about this in another response.
SWR and antenna efficiency are not directly related.

>greatly appreciated. Thanks.

The 6146W is electrically identical to the 6146A. The 6146B is electrically
superior to either in that it has a greater plate dissipation and slightly
different gain and bias requirements. The TS-830 should eat any of them
without indigestion, though you might want to back off the output power
a bit when not using 6146Bs in the final.

>anyone has suggestions.

Deep cycle batteries aren't ideal for float service.
But they're certainly better than starting batteries.
The better choice for float service is Edison cells,
like the telcos use. They can tolerate extended float
operation. Starting batteries and deep cycle batteries
can't. If floated for extended periods, they'll go
high impedance on you due to sulfide buildup on the
surface of the plates. You should periodically draw
heavy currents from them and give them a brisk recharge
to discourage this. Deep cycle batteries want a lower
constant voltage for charging than do starting batteries.
If you use the higher voltage suitable for starting
batteries, you'll get excessive gasing from deep
cycle batteries.

Christian,

to quote out of my TH-22 manual:

TH-22A: Australia / General
TH-22AT: USA / Canada / General
TH-22E: Europe

One difference between the AT and the E is that the E knows
about the (European) 1750Hz tone to open up a Relais, while
the AT doesn't.

>
> 73 Tom

Connectors present an impedance missmatch, which when placed in a constant impedance circuit will create a missmatch loss, not a direct dB insertion loss. In other words the missmatch loss is a function of the impedances involved. One could find a coaxial line impedance at which the PL259/SO239 impedance is very close at any given frequency, and thus the missmatch loss would be very low, even at a high frequency.

Just based on the physical construction, I would suspect that the shield connection between a PL259 and an SO239 is very poor at high frequencies and is resonsible for the impedance "bunp". I have never tried it, but have considered soldering the shields together before screwing on the PL259 outer case.

Is there a source for information on at least the most popular equipment.
I see postings for this and that but most don't list features.
Is there a place to look them up. The Yeasu web page only lists current
models.

Should we start a Web site or FAQ where people who are selling
add descriptions to the existing list and augment existing descriptions?

In my opinion, this price might be a little on the high side. However, it beats $1000+ for some of the newer models on the used market.

I had the HW-100, as well as an SB-102. They are very similar radios, although the VFO design varied among the related models.

The one common problem I had on both radios, was bad heterodyne crystals. It happened that the heterodyne oscillator circuit was designed with marginal feedback. It worked great with very good, high "Q" crystals. However, some crystals would degrade with age, and stop oscillating. A friend was able to isolate the cathode terminal of the oscillator tube, and insert a low value resistor to ground. He was able to somehow use this to increase feedback, allowing use of crystals that had previously stopped oscillating!

The VFO calibration problem could be the result of a heterodyne crystal having drifted. I think a different crystal is used for each band, so the error would be different for each, if that is the problem. If the error is the same for all bands, then VFO components may have drifted. I assume you were forced to realign the dial so that the 500KHz line coincides with the stop.

>Later I disabled the extended RX range and found that all of my channel
>memories and other stored setups (dial xfer, etc) were gone! It was as
>if it was restored to factory settings.

Yup, this is not a problem, but a design feature. What you did was
exactly that, return the radio to factory settings. Note that the
Yaesu manual expressly warns you that this will happen. Get the ADMS
programming kit. For $40 I highly recommend it.

Intermod does not increase with the hardware mod, as it is a change in
the processor end of the unit.

1444. Knwd 6 Mtr mod ?

>I'm thinking about buying a Yeasu FT-8500 dual band
>mobile. Anyone out there have any strong likes/dislikes/problems
>with this radio??

I *hate* the microphone control system. Be sure to play with it
extensively before making a final purchase decision. I did, and
decided the Standard has a better control system. (The Standard
is more intermod resistant too.) Both all-controls-on-the-mike
radios take quite a bit of getting used to, so you *really*
want some hands on time with them before making a choice.

The control systems on both radios have pluses and minuses, and
neither fully satisfied me, but after spending several hours
with each, the Yaesu was still confusing, easy to change inadvertently,
and clunky. The Standard was more intuitive, less prone to accidental
changes, etc. The one major drawback to the Standard is volume control.
That requires two keypresses. On the Yaesu, you've got knobs, but they
feel really cheesy, and I was concerned they might soon break.

I like the display in the mike that the Standard has because I
can use my bifocals on it. In my vehicle, the Yaesu display would
have to be placed at an awkward distance. I also liked the clean
audio out of the Standard better, it is surprisingly good both
from the speaker in the mike and from the speaker in the main
unit. I think you'd want an external speaker on the Yaesu. You
probably wouldn't need one on the Standard.

Both are pretty good radios as radios, so the decision comes
down to which mike control system you like better. I like the
Standard's system better. You may not. So find a place that
will let you sit and play, and think about how you'll be
operating in the mobile while you play. Try all the features,
see how hard or easy they are to master. (I never did get the
Yaesu to go into crossband repeater mode correctly, and I
had help from a knowledgeable salesman, and we called Yaesu
tech support to boot.) Both these radios are serious money,
so take your time and make sure you buy something you can
live with.

The Heath HW-100 and HW-101 transcievers are excellent units. You may wish to check the two 33K
ohm, 1/2 watt resistors used on the plates of the 12AU7 carrier oscillator. They frequently will be found to have drifted up quite a bit in value. The oscillator continues to work, but
the R.F. drive to the diode ring modulator drops off, and on transmit, the drive is similarily
affected. Dial backlash can be improved by lubricating both the Jackson drive and the tuning
capacitor. It is a bit of a chore to de-mount the vfo module and dial, but it is do-able if you
are enthusiastic. You should have no trouble getting the VFO to track across the band. Heath
gives you trim adjustments for both the tuning capacitance and and coil inductance. The easiest
way is to hook a frequency counter to the vfo output terminal. Before you start, tune in the
calibrator at any point, on USB, to zero beat. Then switch to LSB and re-zero with the "Shift" trimmer cap. That corrects the dial reading to be the same on LSB and USB. Now attach
the frequency counter. Set the dial to the high end (500) with the trim capacitors preset 1/2
turn loose from tight. Adjust the coil for 5.000 mHz. Note that the VFO tunes backwards because
of the way the various hetrodyning oscillators are combined. Now turn the dial to the low end
(0) and set the capacitors (looser) to 5.500 mHz. Repeat these steps about 10 times, You will
see improvement in tracking at each step. The VFO will track the dial end to end about as closely as you care to read it, if it was assembled according to directions. Two trimmer capacitors are used in the HW101, the one nearer the front panel is the fine adjustment. (The
HW-100 used only one.) Stop trying for tracking improvement if the screw in either becomes overly loose!

HW-101 is very similar to the SB-102. 90% or more of the circuit is
identical. Most significant difference is in the VFO construction and
some extra front panel switches on the 102.

It is very common for these crystals to change frequency over the
years. ** especially the 15.875 MHz crystal for 40 meter ** I have
seen this one as much a 15-20 KHz off in several HW-101/SB-300/301/401, etc.

This would only effect one band or bands where the HET OSC crystal was
off. Once the "0" point is set on a particular band, the calibration
within the band should be identical from band to band.

Other common (but easily fixable) problems with the HW-101 :

1. Resistors that have changed values.

2. Resistors that have changed values [Get the idea :-)]
I went through one HW-101 that I was restoring and I must have found
near a dozen resistors that had increased value sometimes as much as

50-100 % Go through the radio with an ohm meter and check each one.
You should get a reading across a given resistor that IS NO HIGHER
than the marked value. Reading could be lower due to other components
in parallel - BUT NEVER HIGHER. You might find this hard to believe
until you track down a 33K resistor that looks like new but is reading
250K on the meter. It will do it every time.
Make sure you check the cathode resistor of the driver tube. This one
tends to run hot and is bound to have increased value a bit which
cuts down the drive. I have seen this in an HW-101 and two SB-401's.

3. Slipping DRIVER/PRESELECTOR drive belts. These guys will stretch
with age and cause the two variable caps to fail to track properly.
The result is low drive and sensitivity at various portions of the
band. Very critical on 80 and 40 meters. New o-ring belts should be
available from most decent auto supply houses... though it might be
kind of tricky explaining to the guy what you are going to use them
for. Just take an old ones off and ask for 2 that are the same size
or ever so ever so tiny bit smaller.

4. Dirty / worn band switch contacts. This one HW-101 had power output
that would wander all over the place. I finally ended up removing all
of the band switch wafers (sub-boards) cleaning them and tightening up
the contacts. Afterwords the output was rock solid on all bands.

5. Missing or poorly installed bottom shield. One had some of the
hardware (grounding tabs) missing from the bottom shield. Neutralization
was a bit unstable until I added some additional grounding straps to make
sure all of those shield panels in between the bandswitch boards were
firmly grounded. Do not attempt to align the radio without the bottom
shield in place.

7. Poor grounding between the circuit boards and the chassis. This one is
not too common but sometimes some corrosion between the ground trace and
the chassis will develop and cause all kinds of problems. For starters
make sure that all of the little screws that hold the circuit boards
in are *REAL* tight.

8. I found it very helpful to replace the original 200 ohm carrier null
pot with a miniature 10-turn pot. Makes the null adjustment much much
easier.

Thats about all I can remember for now. These are nice radios to fix up
and can be fun to work on. Just watch out for the high voltage.

The B-K cloning cable is easy to make. I took an old circuit board from a pc, some sand paper, epoxy, file, and a hack saw. The connector spacing of the circuit board fingers is correct, but the board too thin. I sanded two pieces, cemented them together, so they fit into the B-K, and soldered wires to them. Only three wires are used for the actual data. I also added a push button switch to place the radios into programming mode. I know you can buy a cable for $100, but you can also make your own.

I would include the wiring info, but I don't have it handy.

I have this GUS-MAX board. There is a wave-table syntheziser on board, and
you can program it to produce any waveform at any given frequency.

I don't know if there is a "AF signal generator" application program for
this (or any other) sound board. But with WaveLite wich came with the card
you can do some interesting things.

I editted the sound sample (wich is uploaded to the card's wavetable memory)
to change the waveform.

Hi,

I bought a 2nd-handed 2m transceiver a few weeks ago, but there was (offcourse) no manual included in the deal.

This transceiver is a great thing: It's an ALINCO DJ-S1 and it can transmit in the range from 130.00 MHz up to 174.000 Mhz! There are some questions left, after using this thing a few weeks!

- At first, how do I turn on (off) the roger beep! After pressing some keys, It sunddenly jumped on!

- Can I TRANSMIT in the range from 108.0 Mhz up to 143.0 Mhz ? When I try to, it simply says: "Off". If so, how do I do so?

- What are the buttons "TMS", "TONE" and "BS" used for?

If you have an answer to my questions, please E-mail them to me (E.vanElk@ET.TUDelft.NL) Thanks in advance! If you have any other nice stuff about/for the ALINCO transceiver, I'm interested as well!

Thanks,

Edwin

> Thanks and 73's
> Dan nr Seattle
> email N7VOE@aol.comI had both radios and I like the Kenwood 733. The radio seems to be more
sofisticated than the 610. Some major thing I didn't like about the 610 is
on the UHF side, reception is very very weak except on the ham band, the 610
has a detachable face but there is still a cord attached, the Kenwood
doesn't. Well I could talk forever on the differences. E-Mail back on any
specific questions. Good Luck gottria@slip.net

Hello Jim, thank you for the friendly answer.

>Excuse me? The PL259/SO239 is a non-constant impedance connector.
>That is, nobody guarantees that the ratio of center pin diameter to
>external shell diameter is 50 ohms.

If you have a PL connector in the back of a transmitter, the mismatched
section can be allowed for in the tuning procedire. I guess that is what
Henry does with their output circuit, and it shows that PL's worl well on
2m, if well installed.

>>BNC is not a good option, unless cable lengths are very short
>>(a few feet only)

>Where in the hell is THAT written?

Look at any loss vs. cable type table, amd you see that with RG58
(apologies for my typo) losses quickly become very noticable.

The point is, that a RG213 antenna cable with PL's works fine on two
(and even on 70cm) if properly installed and if wetherproofing
is taken care of. The thin cable wont, and BNC to N adaptors
do not solve the mechanical problem.

If I were doing it, I'd use one of the broadband current amplifier op
amps. Linear Technologies and others make them. Their output will
drive about any impedance. I use them for driving too long video cables.

Does anyone have the CAP/MARS mods for the Yaesu FT-2500M? I've check all the ftp sites I could find (including Oakland) and could not find anything on this radio.

I'd also be interested in any other mods aviailable for the radio.

Thanks

Ken

Here are some.
Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========
Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for
the
Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in
the future, I understand the anticipation of Amateur Radio operators
to
find modifications to their equipment. I started this document because
I
want to see _quality_ information circulated as quickly as possible,
in
order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to
see
included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you
know of this mod, please write to me, even if you wish it not to be published. This would save a number of poor radios from useless torture!

Hope you find all of this information useful. Again, please send corrections
or additions to yensid1@aol.com

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must
say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your
NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen.
Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw on side hidden underneath the rubber flap covering the DC power jack. Gently pry apart starting at top; BNC connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT button.

4. Looking on the back of the keypad (front) half, locate green wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You

can fairly easily cut the green wire by simply (and carefully) removing
the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++

IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was
85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt or better) sensitivity at all the points I measured. Transmit was 136-179.995 and 400-511 with power dropping off at the ends but still usable (about 0.5w on the high scale at the band edges).

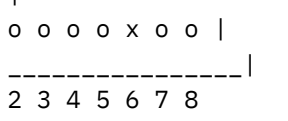
As usual, I take no responsibility for the mods, or your use of the unit
after mod. Please exercise good judgement and don't endanger our ham bands
with your irresponsible actions.

The observations noted are all I tried and I have no further data. This is such a delicate operation that one shot was all I wanted to do,
and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide.
This mod should be done by professionals on a closed track only. Children, do not attempt this at home. Requires extremely small soldering
tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the
DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by
prying the brown latch on the ribbon cable connector up enough to release it.

2. On the front PC board in the lower right corner as viewed from the rear
with the knobs pointing up there are seven spots for diodes in a row,
with one diode missing.



The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an AM/FM demod selector for the 300-400 Mhz band. To access this band, select the VHF band, press F, then press the Low/Hi key. Repeat to return to 144 Mhz. The AM/FM selector will allow you to listen to Military transmissions in the 300Mhz band in either AM or FM.
- Clayton)

++
V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the dual bander's keypad now becomes a function pad. Pressing certain keys enables or disables functions on the mobile rig by sending the DTMF sequences for you.

Please note that all this fuction does is send the DTMF tones over the
air
to control your mobile rig. I have not made a list of what each key
does,
but as the 79 sends the DTMF tones, the display will indicate the
function.
(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as
the TM-732. In fact, if you look at the layout of the microphone
remote
commands for the 732 it very closely matches the key assignments for
of
the "RC" mode. Since I have a TM-732 installed in my car, I had a
chance
to try this out and it's VERY convenient. Everything from direct
frequency
entry with the "F" key to enabling X-Band repeat. I'm really
surprised
they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79
S/N 60300272 after modification. The measurements were made with an
IFR 1200S Service Monitor, on the bench, with a 6V power supply.
Your milage may vary - these are just what happened with mine, and
I would suspect that most units are pretty similar.

++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++

The TH-79 does go into X-Band repeat. Press the "F" key then the
"MONI"
key to enter repeat mode. Use the same to return to normal. There is
a
10 min transmit limit so it's not useable for long duration monitoring
of
a continuous transmission. That's understandable in light of the
number
of horror stories I've heard of people frying their HT's in repeat
mode.

++
VIII. Other Observations, Ramblings, Etc.
++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length
with the Kenwood people. They have been inundated calls about this and
have told me that they are preasuring Japan to come up with a processor
replacement to fix this, perhaps as a retrofit. I encourage any owner of
a TH-79 to write to Kenwood insisting on such a modification at no cost
and asking that they be informed when it is available. I think this is
justified for several reasons. First, I have been told by another ham
that the official brochure indicates that such a feature is included.

Second, and more important, it is arguable that the radio is not suited
to the application without memory lockout. After all, it's an 80 channel
radio. To make effective use of that many channels REQUIRES a channel
lockout function. Without effective use of that many channels, the radio
is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious
missing parts. I didn't remove the board to check the other side, but
my suspicion is that the 800 MHz parts are installed. I'd be interested
in input from others on that. So far I've not discovered how to make it
display any 800 MHz frequencies though."

Greetings to all

I would appreciate it if any body could point me to a web site that contains
the following: Title 47 chapter 1 subchapter D part 95.
The above is the Code of Federal Regulations relating to general moblie radios.
It also contains the rules for CB radios. I have searchd serval web sites
including Cornell Law School's website. I would like to download part 95 of
the regulations in its entireity.

A footnote to this request. It sure is easy to find part 97 which is the rules
for amatuer radios. Their must be a lot of ham operators on the internet.

Please help if you can. Thanks in advance.

I have a National HRO-600 which has VFO(tunable plug-in) problems; need an extender board or cable to be able to get to it while powered up. Can I buy or rent such a piece?

My Eddystone 1837 solid state receiver needs work; is there anyone in US who works on these? How about Canada or UK?

I too did not like the FT-8500 with the "Mr. Potato Head" mic. I ordered
the version with the MH/39 mic and love it. I found it easier to operate
than the 'potato' version and the audio quality better than the
Standard. Programming the radio is a snap with the ADMS-II software kit
which runs in Windows and just somewhat annoying from the mic (I hate
buttons). I did not find the Standard any easier to program from the mic
and they do not offer any software option. Operation is easy with most
commands being one button and no knobs sticking out anywhere on the mic.

I have for sale a Kenwood TR9000 2 meter allmode Mobile Transceiver with the matching PS20 power
supply.

This is a compact Transceiver (measures 6.75" x 9" x 3"), with features include: Memories, Scan, Dual
VFO's, and outputs of 1 watt / 10 watts.

All in excellent condition with manuals.
I am asking $350 for the package.

Reason for selling is that I recently purchased aHF Transceiver with 2 meters built-in.

I can be reached at (716)367-9826 or via e-mail at: jsbraun@vivanet.com

Ahhh, yes. Another person who tells it like it is not.

After I read this article, I took my FT-40 down into my shop, and screwed a SMA adaptor on to it, attached a Diamond RH77 (long duck) to the adaptor, and proceeded to have 3 QSOs through 3 different repeaters, none of them any too close by. Maybe Bill is confused by the gender of the connector, since the radio has a SMA *male* connector on it.

WRT the intermod issue, I brought the FT40 to the top of a tall building in downtown Atlanta, where the UHF side of my FT530 is completely useless, and was able to use a distant, weak repeater with few problems. There was some front end overload, but it did not render the radio useless. The only radios that I have noticed no front end overload/intermod up on that building is a Johnson commercial HT that I have, and a Motorola Systems Sabre that belongs to a friend of mine. So for a under $500 HT, I would say it performs quite well....

>I have both a FT-11 and FT-41. I have had no problems with intermod

: Would like a higher Z output any ideas on stepping up the 16 ohm output?

Why do you want a higher-impedance output? You can always drive a
high impedance load from a low-impedance source. The output impedance
of a signal generator is normally as low as possible.

(Hello Daniel!!)

I've been using an Icom IC-2000H for the last year, and it seems to live up to the promise of the advertising. It is quite good; I have taken it to dense RF radio sites and experienced only very minor intermod. Having used an Motorola MCX-100 in the same application for a year preceeding the IC-2000H, my standards are probably pretty high (the MCX-100 has six sections of helical resonator, a high level RF amplifier and a diode mixer in the front end); the IC-2000 is almost as good.

The Yaesu FT-2500 seems to be comparable.

1486. FS: TI C5x DSP Starter Kits (DSKs)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-29 00:00:00 UTC
From: cole@netcom.com
Message-ID: <coleDLxDon.JIG@netcom.com>
Source record: 206532
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I have several TI 320C5x DSKs (DSP Starter Kits) for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from the TI BBS, accessible via TI's FTP host ftp.ti.com, in directory /mirrors/tms320bbs. The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them through distributors can be a hassle. I'll sell them for $60 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are OK but I'll wait for them to clear. No CODs, please.

1491. PRODUCT REVIEW: ProGold and DeoxIT, CAIG Laboratories

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-29 00:00:00 UTC
From: mc@shore.net
Message-ID: <4eieda$q1@northshore.shore.net>
Source record: 206537
Cross-posted to: rec.radio.amateur.equipment,rec.antiques.radio+phono

PRODUCT REVIEW: ProGold and DeoxIT - CAIG Laboratories, Inc.

One of the most difficult areas of electronic equipment maintenance and restoration is cleaning and preserving electrical contact points. As these component surfaces and areas become dirty and eroded due to friction, wear, arcing, etc. Switches and relays are difficult to replce both from a logistic standpoint as well as the actual installation of the new part.

Over the past few months I have been engaged in rejuvenating several old pieces of amateur and military pieces of radio equipment. These include a Johnson Viking I transmitter, a Collins R-390 receiver, a Collins KWM-2A transciever and a rare RS-6 "spy" radio set from the Cold War 1950s. All these radios are valuable and getting hard to find. The above five pieces were all in excellent cosmetic condition, unmodified and clean. They all had something in common: switches and relays would be hard to find and difficult to replace.

Good electrical contact is paramount in these older receivers and transmitter circuits - degraded or non-performance can often be traced to dirty, corroded intermittant electrical contact. CAIG Laboratories in San Diego CA produces a line of chemical products to clean and condition electrical contacts. I used CAIG's ProGold and DeoxIT for these valuable pieces of old radio equipment for my personal collection and made the following observations.

Both ProGold and DeoxIT come in different configurations - spray and needle applicators at both 5% and 100% concentrations. The 5% dilutions are carried by petroleum naptha solvent which is flammable until the solvent evaporates. For applications where a non-flammable carrier is used, another fast-evaporating solvent is available. Some of the confgurations offer metered short bursts - after all the stuff's too good to waste!

I personally prefer to use anhydrous isopropyl to clean contacts so I used the 100% concentration in the 25 mL needle applicator to condition and deoxidize. For quicker jobs the spray would also be useful in tight places. I used both DeoxIT and ProGold in my rejuvenations - depending on what kind of contact I wanted to restore. I used ProGold for plated surfaces because it deoxidizes and cleans surface crud, but more important, it penetrates plated surfaces and its molecules actually bond to those of the base metals. I also use it to enhance connctions between similar and dissimilar metals such as gold, copper, silver and other metals.

Many of these older pieces of equipment have carbon potentiometers. Solvents are not advisable to clean carbon pots - most of the time these controls and their contacting surfaces only need lubrication to extend their life. I used 100% concentrate ProGold, turning the pot several times to distribute

the chemical. I was impressed with the results - noisy, scratchy pots greatly improved. I plan on applying ProGold once a year to try to maintain their performance as-is. I used DeoxIT for general purpose contact treatment. A little goes a long way.

My findings are that these products are useful for restoring older radio equipment without concern that they contain anything that will do damage. I certainly plan on keeping both ProGold and Deoxit in the front row of radio service and maintenance supplies.

Most major and many minor ham radio equipment dealers sell Nye Viking straight keys. They're reasonably priced and will literally last forever in normal service. You will not go wrong with one of their keys.

Fair Radio Sales often sells surplus WW-2 J-38 straight keys, sometimes used, sometimes new. This is the ultimate "classic" straight key, and will definitely last forever even in harsh service. They go for about $30 for a new unused one. Definitely a good key.

Watch the hamfests and swap meets too.

Good luck and 73 from a dedicated CW buff!

>
>I just paid $200 for an HW101 Heath transceiver. I expect to listen until
>I get my ticket then be able to transmit. I have the following questions;
>1. Was $200 a good price?

$200 is too much, IMHO, depending on what came with it (mic? filter? spkr?)

>2. Any comments in general about the unit? Anything I need to look out for
>?

Reputation for good audio on SSB. Optional CW filter is excellent performer.
VFO difficult to align, and usually needs it. 6HS6 tubes don't last long and
are getting hard to come by.

>3. I went through the alignments but can't seem to get the VFO dial to cent
>er.
>Its calibrated but the 500KHZ line is right at the hard stop. Any comments
>?

This is not an easy task. You have to keep after it. Follow the alignment
procedure in its entirety, don't just try to do part of it. Sorry to say,
you'll wear out your fingers and wrists spinning that VFO dial back and
forth over and over, and there's a likely chance that you'll never quite
get it just right. Get it as good as you can, and live with it.

>4. There is about 2KHZ backlash in the VFO drive. What can I expect? Is the
>re
>any information out there about Jackson drives? Who made them? Are there an
>y
>comments about reducing or eliminating the backlash?

Sorry to say, the drives are sloppy when new, and get worse with age. I am
not aware of a supplier for them, but they're reasonably easy to locate on
the used parts market. Look for someone parting out a HW-101 (there are
plenty of them around).

>5. Are there any receiver mods out there?

There are a number of mods for the HW-101 over the years. Search through
the Annual Index of QST and other mags from about 1970 through the early
1980s and look for ideas, including Hints-N-Kinks.

>6. Are there any simple 160m to 80m converters out there?

No experience here. Look in older ARRL Handbooks, QST, Ham Radio, CQ, 73,
and other radio publications for 160m transverter projects.

>Thanks.

You're welcome. Good luck with the HW-101. When properly aligned, cared for, fed, and nurtured, they will serve well.

I have restored about a dozen of them over the years.

Does anyone know if QST reviewed the Yaesu FT-840? It is one of the rigs that I am considering, and such a review would (naturally) be of great help.

Of course, if anyone would care to pass along their hands-on experience with the rig, it would be appreciated!

Thanks!

Hi,

I got a Yaesu FT 767 GX, with 144 Mhz unit. It's a good rig, expecially
for the coverage of all bands.
I was looking for the other units:
430 Mhz unit
50 Mhz unit
FTE-2 tone unit
FTS-8 CTSS unit
I would like to know how to find them, since Yaesu Europe doesen't have
this spare parts !

Thanx for help in advance.

I have a 757GX that is still in the box I sent it to Yaesu in. They sent it back with a note saying that it was not "economicially repairable". The band diodes are the problem. After fixing it several times myself I got frustrated and sent it to them... I am now the proud owner of a TS-50 w/AT50... Still miss the receiver in the 757GX though... Might fix again.

>
>Any ideas?

Sure, just use a pair of reed relays to select the sideband and steer the coils with diodes off the bandswitch. Simple is usually better. This isn't so complex that you need to throw a PAL or microprocessor at it. Just diode OR 80m and 40m to the LSB relay coil, and diode OR the rest to the USB relay coil and you're done. Suitably tiny reed relays that'll work off 8 volts are easy to find.

>Would like a higher Z output any ideas on stepping up the 16 ohm output?

You can step up the impedance with an audio transformer if you need a
power match. That's seldom the case with a signal generator, however.
Normally you'd just bridge off the low impedance source with *build out*
resistors, IE you want a 10,000 ohm source, you put a 5k resistor in
series with each of the output leads. To the load, it looks like a 10k
source. (Or if you want unbalanced, just put a 10k resistor in series
with the hot lead.) You can use several sets of build outs off the same
low impedance source and they won't interact or load down the source
to a noticable degree if the build outs are at least 100 times greater
in value than the source's output impedance.

>Use of large (>1" wide) flat braid out the window to a ground rod may help
>in your situation. The braid will have less inductance.

Braiding is great at DC, but it is terrible for RF or lightning grounds.

Since both lightning and RF follow the surface of the conductor, braided or woven wires force lightning or RF along a lossy roller-coaster ride of hundreds or thousands of pressure connections. The RF or lightning path is not only longer, it has lossy pressure connections where the current moves from one strand to another at each weave!

Braiding is great for car battery and power supply wiring, but it's much better to use flashing for RF and lightning protection. If you have to use a flexible wire, use stranded wire with minimum amount of twist.

>under noisy and/or crowded conditions?
>
>How does its SSB audio signal sound? How does its CW signal sound?
>
>What is its duty cycle?
>
>Are there any known problems or quirks with the unit?

HI, just thought I'd throw in my $.02 on the ft-840...

Bought one last summer for use as an economical mobile. It has given good service in that capacity. I did take it portable to the beach with a DC linear amp, and had some good results there...

I'd say the receiver is above average, in terms of quietness and sensitivity. I did not use it in any contest environment, nor have I tried it on CW. I like the display, control layout, and size of the unit. I do not like the lack of an RF gain control; if noise levels are high I can't reduce signals enough to make copy pleasant. All you can do is kick in the attenuator, which doesn't do it....

I don't know what the duty cycle is, but the RF section looks a little meager in the schematic (one transistor, where most designs use two...)

TX audio is fine, once you replace the hand mic (I bought a Heil HC-5 element for 25 bucks and (carefully) soldered in place of the standard Yaesu element in the hand mic - works vy well)

In all, I think if I had it to do over, I'd pass up the 840 and go for the IC-706, but it wasn't available then. I'd still recommend the 840 for mobile/portable applications, but don't think I'd want it for my main rig.

John

1514. Sony ICF-2010 AGC problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: jwa@tellabs.com
Message-ID: <1996Jan30.131300.25049@tellab5.tellabs.com>
Source record: 206360

In order to clear up the Sony ICF-2010 A.G.C. problem, I prepaired
this file

The Agc is in the I.F. stage and that's where the problem originates.

********** * = stock filter bandpass
* x | x * x = narrow filter bandpass
* x | x *
ICF-2010 * x | x *
455 KHz I.F. --> * x | x *
USB | LSB

I.F.
Center Frequency
455 KHz

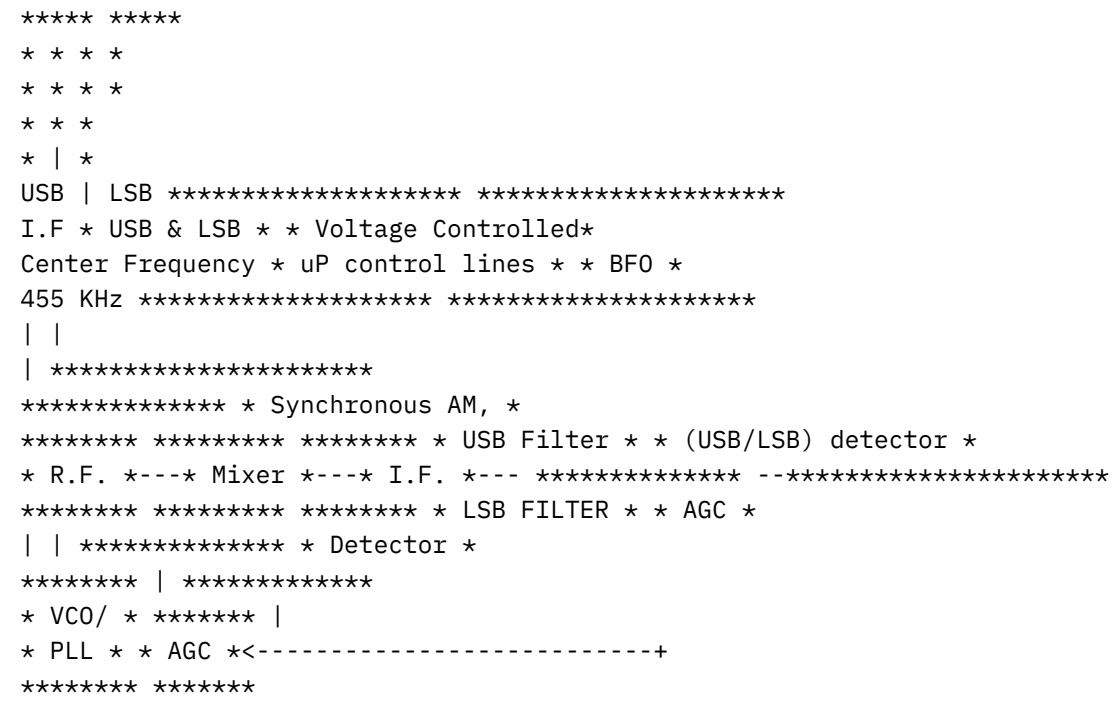
The problem (as shown above) is caused by the Sony ICF-2010 I.F. bandpass
filter that passes signals above and below the I.F. center frequency.

****
* Synchronous AM, *
******** ********* ******** ********** * (USB/LSB) Detector *
* R.F. *---* Mixer *---* I.F. *--- * I.F Filter *----------
******** ********* ******** ********** * AGC *
| | * Detector *
******** | **********
* VCO/ * ******* |
* PLL * * AGC *<-------------------------+
******** *******

The Synchronous detector, following the 2010's I.F., is used for AM
synchronous mode and for SSB reception. Using an audio phase shifting
technique it rejects the other sideband thus preventing it from entering
the speaker. During lower sideband reception, if an interfering signal
falls below the IF's center frequency, for example, it will pass through
the I.F. filter and get rejected by the synchronous detector. You won't
hear it because the radio is in LSB mode but the AGC will respond (by the
way, The mixer flips the LSB such that it appears above the I.F. center
frequency. The USB will appear below the IF's center frequency).

If you install a narrow filter that's center around the I.F. to correct
the problem, you will simply reduce bandpass and limit the audio response.
The A.G.C. will still respond if an interfering signal falls within the
frequency range of the other sideband

My scheme uses two I.F. filters that are centered above (for lower sideband reception) and below (for upper sideband reception). The filters are selected by the micro-processor using the USB and LSB control lines and PIN diodes. Therefore it only passes the received sideband and rejects the interferance.



The dual I.F. Filters are Collins Radio Torsenal Mechanic Filters ($150.00 each). The USB filter is 2.6 KHz wide tuned to 453.7 and the LSB filter is 2.6 KHz wide tuned to 456.3 KHz.

This is not a cost effective way to impliment sideband filtering. Most communications receivers use a single SSB filter for upper or lower sideband reception. The BFO frequency is changed by selecting a second BFO crystal. Shifting the BFO frequency on the 2010 would have required the re-designing the phase locked BFO that's used during synchronous detection. The circuit is heavly shielded and there's only enough room for one crystal.

1515. R7100 Modification

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: .
Message-ID: <4ejqb8$6e5@news.ios.com>
Source record: 206361
Cross-posted to: uk.radio.amateur,rec.radio.shortwave,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.scanner,alt.radio.scanner,alt.radio.scanner.uk

Ever since ICOM decided to delete the 800 - 900 MHZ coverage from its IC-R7100 receiver,
older R7100's demand premium prices on the used market. ICOM insisted that the R7100 was
now made in two versions, one for the general public and another (with 800-900 coverage) for
government and law enforcement agencies. The extended coverage version also sells for $200-$300 more! Per discussions with ICOM there were very clear that this was done to comply with
legal requirements that prohibit new scanners from be capable of receiving cellular telephone
transmissions. My opposition has always been why we should be penalized if we want to listen to
local law enforcement agencies within the 800 MHz band. Personally, I have no interest in
listening to cell phones when a receiver as competent as the R7100 opens up almost 2 ghz of
spectrum.

I recently noticed that Grove now offers the R7100 with "restored" coverage so I set out to find
out how it was done. Performing the following procedure will allow you to listen to local law
enforcement with the 800-900 mHz portion of the spectrum. Remove the screws that hold the top
cover and disconnect the speaker. Next, remove the two flat head screws that hold the metal
shield covering the rear of the front panel.. On the rear apron, remove the two screws that hold
the upper chassis to the lower chassis. Finally, remove the antenna cable that is connected to the
circuit board assembly in the rear right corner of the R7100. Referring to the owners manual,
CAREFULLY separate the upper half of the receiver, inverting it, setting it beside the radio as
illustrated in the owners manual. Be careful not to pull on the cables that connect the upper
portion to the lower half of the radio. In the front of the owners manual there is a small paragraph
that explains the various jumper options for the R7100's CI-V interface options. It's on this board
that the modification is done. The board is located behind the "M-SET" switch. The jumpers are

actually circular pads, split vertically. A drop of solder constitutes a jumper - no solder = no
jumper.

Locate jumper "A6" as illustrated in the owners manual. Above "A6" you'll see a small ball of
solder. Using solder wick, CAREFULLY remove the solder, exposing the split circular pad
beneath. The space between the pads is very small so be sure to remove all the solder. Reassemble
the radio and you're done!

>> are particularly bad. Is this a valid observation? How do
>> other makes compare? Thanks.

Wideband is not the only issue. The problem rests in that hams
accepted the "you can't have your cake and eat it too" explanation. You
can. To over simplify this; the problem is usually solved by building a
reciever front end that is tuned by the microprossecer as the frequeny is
changed. This adds to the expense of the radio, a important issue in the
amateur market.

Commercial users require a radio capable of tuning the full range
from 136 to 174 Mhz. Marketing is simplified. Furthermore, users are
faced with frequency allocations that can be at opposite ends of the bands.
For instance, Federal agencies with allocations in the 160-170 and 136-144
range wanting mutual aid with locals in the 155 area. Wide band radios were
developed FOR comercial and governement users because they had a use for
them. Comercial and Government users also are willing to pay more than
amateurs to solve a problem they NEED solved.

Most amateur VHF gear is probably substandard. The amateur market
is driven by bells and whistles, not heavy duty and IMD rejection. There
are exceptions. When a manufacture of commercial gear goes into assembly,
it is cost effective to mass produce. Often times a radio mass produced
for sale as a type accepted commercial transceiver is marketed to amateurs
under a different model designator and control pannel. It is ironic that
the same radio guts sold to government and commercial users is sold as a
non-type acceptance amateur radio. You pay lots for that type acceptance.

Icom, Yeasu and Kenwood all make comercial radio gear. In some
cases under a different name. They also all have amateur radios for sale
that are commercial in disguise. Some if these are execellent performers.
Some radios I have experience with that meet this criteria are the
ICOM IC28A IC28H, YAESU FT2400, YAESU FT2500, KENWOOD TM251. There are
more I'm sure. I've hooked these radios up to high gain base station like
antenna in very hostile environments and havent heard a peep. In one case
a Yaesu was quiet when a Spectra in my car parked outside was making all
kinds of noise.

My point is that IMD performance is all a matter of engineering. If
your looking to buy the challange becomes researching the available gear.
QST product reviews are good. For amateur gear, look at the THIRD ORDER

IMD 10 MHZ FROM 146 MHZ figure. The higher the better. 95 DB and above is good. The second figure to look at is AJACENT CHANNEL REJECT 20 KHZ OFFSET FROM 146 MHZ. Again the higher the better. Dont settle for less than 70 Db. Current dual band radios dont seem to measure up yet. Check the QST reviews.

Technical solutions do exist. Using a "TX-ID" board, which uniquely
fingerprints each transmitter and a PC one can "slectively" include or
preclude individual users.

The board was not meant for that purpose, but with just a little Basic of C
codes, it workd just fine. It is especially easy if you have a single or
limited number of receive site.

Good luck and Have fun.

I'd be interested in knowing more about these as well. I think there
was a thread about this a couple of weeks ago in this newsgroup, but I
missed it, except to find out there is a company that sells an
"Eartalk" speaker/mic. I'm interested in finding out about audio
quality, especially for the mic.

Source record: 206365

I've inherited an old Cobra 138XLR CB that's been converted to 10M Amateur.

It seems to work and it covers 28.487 to 28.939 MHz.

I'd like to pass it on to my dad, but he can only operate 28.3 to 28.5MHz,
so I need to lower the frequency a bit - center it on 28.4 MHz where the
local club net meets.

The rig came with no documentation - neither the original CB schematic or the
ham mod instructions.

Anyone know where I can get CB-to-10M mod instructions for this rig so I can
retune the synthesizer properly to get it where I need it?
I have the needed test equipment - counter, spectrum analyzer, power meter, etc.

Thanks & 73,

The TM455A 430 allmode by Kenwood has dropped drastically in price (almost half), has anyone heard any rumors of another model coming out? Possibly a true allmode that covers 430-450 and not just 430-440 as the 455A does.

> It's also possible to extend TX capabilities ?

I don't remember the exact buttons, but basically as I recall
you simply hold one of the buttons (numeric pad plus some
others on the right side of the rig) while the rig is
powered off and then power the rig on. The 2 meter module
will cover a bit more than the entire band, but I don't
think it covers 140.000-149.999. Likewise, the 70cm module
can be tweaked with a different button being held. Once
set, the radio remembers the settings between use. Note that
there are separate modules for 430 and 440 and one module
I don't believe will operate over both ranges.

>Thanks,
>Paul KB6FPR
>epapd@ix.netcom.com

I picked up an 8500 a month or so ago, and although I had trouble with it at first, I find the feature-laden mic just fine to work with.

I will admit that sometimes the knobs and buttons can get in the way of talking, especially when wearing gloves, but I just leave the mic in my lap, and can adust or activate most of the functions without reaching forward to the display or taking my eyes off the road.

The spectrum display at first seemed like a gimmick, but once I started using it, I found I wasn't jumping around to see if various repeaters had traffic on them; one press of the button shows all activity on a given 10 frequency bank. I would reccomend the remote mounting kit for mobile use. It comes with extension speaker and microphone cable, as well as the cable for the remote display. It's expensive, but it would have been a pain in the neck to install the radio without it. Also , the Windows software would be a bargain at twice the price, and is the primary reason for choosing this radio. I use similar software with my Yaesu FT-51 H/T, and can't say enough good things about it.

The MARS/CAP mod is a simple one, and the one I got was right from Yaesu.

Negative observations:

Maybe it's because I mounted the radio under the passenger seat, but the internal speaker lacks punch; I've installed a small external unit that covers both bands.

The display is great at night. The contrast can be adjusted, and there are many auto and manual backlight options, but it isn't that good in bright daylight. It's readable in any condition, but my Alinco DR 600 was better in the daylight.

The PTT button on the mic doesn't "click" in; a detent would give the operator a more positve feel when transmitting.

For all the technology Yaesu stuffed in this radio, the user cannot assign and display alpha-numeric "tags" to the autodial memories. It was very frustrating

when setting up the radio, because you can enter a 6 digit alpha name to an autodial, but you can't display it! Where's the sense in that? Numerous calls to Yeasu tech support went without any satisfaction. The last guy I talked to agreed that it's dumb to be able to assign a name to an autodial memory and not be able to recall it, but conceded that that's the way the radio is built. Doesn't make sense to me.

If you end up with this radio, you probably won't be dissapointed. After a month of daily use, I don't regret buying it. If it weren't so damn expensive, I'd probably get another one for the house. Good luck with whatever product you buy, and feel free to e-mail me if you have any specific questions.

1525. ICOM 706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: Veldman@esass.iaf.NL
Message-ID: <310e4923.esass@esass.iaf.nl>
Source record: 206371

After having followed this newsgroup for a while, I have the following questions and remarks:

1) This modification from Gary Coffman to stretch the receiving till about 200 MHz, by removing C53 and moving C153 in parallel with C152, has anyone tried this already? Did Gary try it himself already, or is it still just a computer simulation that hasn't been comfirmed in the real world?

2) Why is the fan running during receive? It shouldn't be necessary to cool the Xmtr AFTER transmissions, because the PA doesn't add heat anymore once it has been switched off, and the heatsink will only get colder, with or without help of a fan. Granted, it will cool down faster, but that doesn't prolong the life of the radio in any way. Or does the radio generate so much heat during receive that it is necessary? I'm planning to increase the value of the 'idle' resistor to get it to the point where the fan is barely running. That should be enough and reduce audible noise.

3) Some modifications in the software could improve the radio even further. The radio really NEEDS the pre-amp while listening to 2 meters, but it should be definitely switched off on 40 and 80 meters. I would be happy if I could configure the radio in such a way that it switches on the pre-amp on 2 meters, but switches it off on the HF bands. A nice fix would be if the memories of the radio 'memorize' the setting of the pre-amp for each memory channel. Same again with the compressor. I want to use it on channels where I programmed an SSB frequency, but not on memory channels where I programmed an FM frequency. Same again with the VOX. Why can't the radio memorise all this per memory channel?

The same would be true for the FM step sizes. It would be nice if you can program it to switch to 25 kc on 2 meters, and to 10 kc on CB or 10 meters.

My little Yaesu FT-51r handheld puts all information in memory channels, like X-mit power, step size, etc. I found this to be very convenient.

4) 2 meter repeater use is a disaster. If you program some repeater frequencies in a memory channel, everything works fine until you decide to listen to another repeater, and turn the main dial. After you found another repeater and want to join the rag-chewing, you press the mike, and guess what, you are still transmitting on the repeater that was programmed in the memory channel. Why can't the 'split offset' remain 600 KHz, so that the x-mit frequency follows the receive frequency with a distance of 600 KHz?

5) Using the 1750 Hz tone to open up an European repeater is too clumsy to be usefull while using the radio in the car. It would be nice to have a additional button on the mike for this, or at least a dedicated button on the rig itself. Now you have to go to the menu and search for the right menu entry. After you have finally found it, the name of the repeaters don't show up anymore (since you are not in G4 anymore). It would be nice if the 'call' button (which you don't use during Xmit on 2 meters) would generate a 1750Hz tone. In Europe, you need this 1750Hz tone so much that it deserves an easier accesible place.

6) Has anyone experience with increasing the lenght of the separation cable? I sometimes want to join late-night nets, and this would be more comfortable from within my bedroom. After I planned to wire coax cables to my bedroom, and moving the transceiver, power supply, auto tuner, etc. from the shack to my bedroom and back again in the morning, I realized that it is much easier to cut the separation cable, put some computer-alike D connectors on them, and wire just a 10-wire cable from my shack to my bedroom. This would allow me to use the 706 on either place, without the need to transport everythin back and forth except for the front of the radio, and without boring my XYL with the sound of the annoying fan of the radio (which now stays in the shack all the time!). I guess this can be done without any problems.

7) Can the main SSB filter which is 2.4 KHz be replaced with a 1.9 KHz filter? The option filter I use is a 250 Hz filter, so I don't have place anymore for the 1.9KHz option filter. If it is possible to swap the 2.4 KHz filter for the 1.9 KHz filter, I would consider to do this. I guess this filter is used also for transmitting, so I wonder what the result would be if I swap it?

Despite of some shortcomings to the software of the radio, I really like the little gem!

Go to the Arizona Repeater Association's Home Page to see how this is done. It involves actively pursuing people who engage in such activity. The ARA, as a matter of routine, has an interference committee dedicated to tracking these people down.

Despite reports to the contrary, the FCC does frown on this activity, and will enforce sanctions. Just ask the people here in Phoenix about that. An NAL, Notice of Apparant Liability, carries a stiff monetary fine, about $20,000 (US) worth and forfeiture of ALL broadcasting equipment and license(s).

It has been reported to me, by Dan Ford, Commander of the SHERRIF'S Ham Radio Posse, that they also plan to actively engage in pursuing people misusing radio gear in Maricopa County. I strongly suggest that if you plan on jamming a repeater in Central Arizona, plan on getting caught.

Unfortunately, the ARA has had, for the 3rd time its existence, had to remove a member, by board action, for misconduct involving repeaters. This "gentleman" is also facing stiff legal sanctions from the FCC.

In 1995, the 3 biggest abusers of ARA repeaters WERE caught, and several others have been identified.

How did you interface the TNC to the radio? My Paragon has a audio
input on the rear, which can be used as an input from a TNC, BUT
the manual states very clearly that this audio will be mixed with
audio from the mic when using voice and should not be used unless
the device connected to it does not output audio when the front mic
connection is used. I would suspect that the Omni is the same.
Therefore I connect my TNC to the mic connecter and switch between
voice and data by changing the plug. Acutally, I cant remember the
last time I transmitted voice on HF....

> the key sequence is for this mod?

If it's anything like my FT-5200, just connect the antenna and
switch it on. You'll hear plenty of out-of-band signals, and as
an added bonus you won't even have to move the tuning knob!

But seriously folks...

Sorry about the lousy English, this is as I received it from
the now-defunct Yaesu Europe BV office in Amsterdam:

"Please make jumper on the INTERFACE unit as following which
jumper are freeband for the FT-5200 and it should be need
programming frequency.

On the interface unit jumper position JP5001-JP5007 as
following:

JP5001, JP5002, JP5003, JP5006 and JP5007 ..... Short
JP5004 and JP5005 .... Open

Please note: Free band frequency range are approx following.

For VHF: RX 110 - 180 MHz TX 130 - 180 MHz
For UHF: RX 330 - 480 MHz TX 425 - 465 MHz

Programming Frequency:

Please push and keep "D/MR", "F/W" and "REV" button while
power switch on. Now programming frequency for VHF low edge
of RX, high edge of RX, low edge of TX and high edge of TX,
then UHF frequency programming same as low edge of RX, high
edge of RX ... high edge of TX"

So now you know! :-)

1543. Clegg FM-27B comments

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: campbell@nrult1.dnr.ohio.GOV
Message-ID: <9601301433.AA14063@nralpha1.dnr.ohio.gov>
Source record: 206389

I would like to make some additional comments regarding the Clegg FM-27B. I agree with both WA2BAU (Gary), and KE4ZV (Gary) that the 27B had a notoriously dirty transmitter. In fact, here in the local area, we often referred to it as the Clegg Splatter-Box. I owned one of these things for several years back in the early seventies, and considering the radios which were commonly available for 2-meter amateur use at that time (Drake ML-2, Regency HR-212, etc), the 27B was a major break from the shackles of crystal control. The procedure for tuning the radio consisted largely of zeroing the other station's frequency on the discriminator meter, then spotting the 27B's transmit frequency to zero. This was all well and good as long as the 27B's discriminator circuit idled at zero on the meter with no signal being received. If your discriminator meter happened to idle at some point other than zero, and you spotted both the other guys signal and your own transmitter to the zero indication on the meter, the net result was that your transmitter would be off frequency, sometimes by as much as several kiloHertz. The best way that I found to ensure that you were reasonably on frequency was to spot both the other station and your own transmitter to the exact same meter reading as was present with no signal being received. If you used a reasonable amount of care during this "spotting" process, you could usually keep your transmitted frequency within a kiloHertz or so. That is not really much worse than today's amateur-grade VHF equipment transmit frequency tolerance specs.

With respect to the transmitter spectral purity, don't EVEN think about tuning the 27B transmitter for maximum power output. To do so will almost certainly assure that the output spectrum display will look like a picket fence. The only proper way to tune this transmitter board is by using a spectrum analyzer, and tuning everything for the cleanest output spectrum. If you use care, you should be able to tune the transmitter for a clean output spectrum, and a reasonable amount of RF power.

As Gary stated, I would not really recommend using this radio in a crowded 2-meter metro area. If you live in a less congested RF area, and use care when tuning, you should be able to put one of these things back into service. Just remember to consider your fellow Amateurs, and either check the transmitter spectral purity yourself, or have it checked by a two-way service tech before putting the radio back on the air.

I currently own a Icom 737-A with the vox that I am planning to trade for either a Icom 706, Alinco DX-70T or Yaesu FT-900AT.

Has anyone had any experience with these radios?

The Icom 737-A is a nice radio but as for mobile use it is too big for my car and a new radio is cheaper than a new car (although not by much).

The Icom was bought new in January 1994.

Any comments would be appreciated.

Source record: 206391

Bob,

The At-100, 160, and 500 all have the ham band limitation as does the built in tuners. The ICOM radio uses an analog switching voltage, you can test this your self as it is located on ACC 2. I forget which pin though. When the radio changes bands, this analog voltage is used to switch the band relays or switches in the auto tuners. The 80 meter switch is made right at 4.000 Mhz. here the tune is set up for 7 Mhz operation. No way to change it that I am aware of. The external devices like the 2 and 4 Kl and the EX-627 also depend on this voltage for band switching. This scheme goes back many years in the ICOM hF line up. Not likely to be changed soon as it does work very well.

Source record: 206398

Hi there, Just a note on Ten Tec. I have used Yaesu Ft 1000 and Kenwood TS950D and I like my OMNI V best of all....I sold the FT 1000 in favor of OMNI V. But taking nothing away from FT 1000, it is a great rig. I have used a TEN TEC Corsair, it is a fun radio, hears well, has a good sound. The CW capability of the TT products cannot be beat. THEY SOUND GREAT. The audio is super, comparable to Collins. It takes a while to get the feel of the radio, it is not perfect but neither was the FT 1000, but after becoming familiar with it....You may become one of the TT Cult..... There is a reason why they are still around, and it ain't because it is Made In America. Mainly functional Engineering, not alot of bells and whistles, good price, good resell value, outstanding, friendly, helpful, service, and General Coverage is not a selling factor, buy yourself a Sony 2010 if you want to listen to radio Havana Cuba. Now if you want to hear more on Ham Bands, have a good sounding CW signal...I compared listening to a weak SSB signal on 80 Meters and switched to a TS940S Kenwood. I could not hear on the Kenwood due to Phase Noise internally generated inside Kenwood but could hear them on the Corsair. Phase Noise is like a background white noise you hear on a frequency not tuned to a station, it masks the signal underneath the phase noise. I suggest the Corsair II or the Omni V. The Omni VI may be better but also more expensive. Anyway once you use a Ten Tec....for 15 days....You will be like the rest of us....The Ten Tec Cult! 73 Mike W7CFL

>73,
>Todd
>N9MWB
>

The U33BBA1000A is a 25 watt single channel 150-162 Mocom 70 carrier squelch
The U33bba1900A is the same except multi freq, I think
The U43CMT100a is a 35 watt single, maybe dual channel MOTRAN vhf unit.
The T43MHT1190B Is a 35 watt vhf 150-162 MOTRAC MOBILe, Probably 2 Channel.
The T73MHT4190A is a 110 Watt vhf 150-162 Motrac mobile multi freq, with private line
and some other option.
The T43RTN1190B is a 35 watt Micor, 150- 162 MHZ 2-4 channel.

All of these units will Convert to the high end of 2 meters with only tuning.
The MICOR will need front end coils changed for below 146.00
&3 Good Luck

1558. FS: KPC-2 TNC and 145.01 Base

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: "Robert J. Hall" <rjhall@mtu.edu>
Message-ID: <Pine.SUN.3.91.960130030917.18389D-100000@techsrv1.tech.mtu.edu>
Source record: 206404
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap,rec.radio.amateur.digital.misc

Hello .. I have decided to sell my KPC-2 Packet radio TNC and
Regency BTH-201B 25 Watt VHF Tranceiver crystalled to 145.01 MHZ.

I am asking $70 for the KPC-2 ALONE.
The KPC-2 With the REGENCY BTH-201B radio I am asking $135
I will also be asking $5 for Shipping.

The Regency base station is all ready to go and is Currently wired and
working well with the KPC-2. The base station has it's own built in
Power supply. Size is approx. (15" x 9" x 3.5") Regency BTH-201B 25 Watt
VHF Tranceiver crystalled to 145.01 MHZ. Receiver sensitivity and
selectivity has been recently checked on a 2400 Motorola Service Monitor
and checked up to factory specs. Output power bench checked at 30 watts.

I am not interested in selling the radio seperate from the TNC, but would
be interested in selling the TNC alone. If I don't sell them I'll
continue to use them, and If I don't sell the radio with it, I'll crystal
it for voice and use it there.

The KPC-2 has version 2.85 firmware and has PBBS, NODE, and DIGI
functions. It's run well for the last 4 years without ever having a
problem. It originally cost $170. I orginally purchased the Regency
about 2 years ago from a friend for $60 and recrystaled and tuned it for
another $30 from Jan Crystals. It works well and also has never given me
any problems.

I don't normally have time to monitor the news groups so any response to
this should be via e-mail or phone listed below.

Source record: 206405

Hi Tom here...

I have a couple of working "M" Micor mobiles,
100W version Model #T74RTA3900BA <as best as I can read the model#>
All solid state units... It appears to be a unit with a built in
offset an "1" Xtal for the Rx, per channel <4 ch units>

I was told that the one Xtal per channel type rig with a simple mod
could be modified for simplex operation. I would like to
set these rigs up on packet back-bone freqs <S> an run them as
Rose switch radios on the back bone freq 446.125.

Anyone with any insight in these radios know the mod????

I have owned the K'wood 733 since July '94 and am very satisfied. Would
I buy it again? - Yes! Intermod is not a problem in my locality but it
may be a nuisance in downtown areas of cities. I plan to add the CTCSS
decode board to my rig soon. Programming is easy, audio is good, and it
has extended Rx "right out of the box". The TTP mic can be programmed to
control most rig functions and K'wood is coming out with a BACKLIT
version soon.

The Alinco 610: I set up the memories on a new one for a friend. The
610 has more memory slots than the 733 (100 vs. 70) but the method of
getting from one memory bank to another on the 610 is awkward. The 610
doesn't have auto repeater offset which I think any rig that sells for
600 bucks should include.

Buy the Kenwood, and enjoy ! 73, N2PNX.

1561. Re: Advice-Yeasu FT-8500

I love my FT-8500. I did not like Mr. Potato Head so I opted for
the MH-39 mike and I am glad I did. I also have the ADMS-2 programming
kit and love that too.
My only complaint is with the Automatic Receive Mute options. In
case both bands are busy at the same time, the 8500 only offers the
option of either always muting the VHF band or always muting the UHF
band. On my FT-51R HT they offer the option of muting the sub-band (the
band NOT currently selected for operation) and that seems as if it would
have been the logical option to put in the FT-8500. I guess the
programmers at Yaesu don't talk to each other.

1562. Sources of electron tubes?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: Mike Putter <putter>
Message-ID: <4elekc$4sp@wn1.sci.kun.nl>
Source record: 206408

Hi,
We received an old, but usefull, instrument that has an RF
amplifier in it. That thing uses tubes and some of them are
weak. Unfortunately, we can not find replacements. It would be too
bad if we would have to trash that machine.

Does anybody know a source of electron tubes? Specifically, we need
a type 8458 (same as Philips YL1240), an RCA 6EB8 (or 6CX8) and an
Sylvania 6AL5 (=6058).

I appreciate any help or suggestions.

Thanks, Mike

Message-ID: <4ekgt1$13a@rebecca.albany.edu>
Source record: 206409

Hi!
I'm looking to buy any cheap HT's either 2m or 440...
The radios must have at least a working battery and antenna (I don't care about any other accessories) AND MUST be either already modified or be able to be modified for out of band TX/RX for about 130-170 Mhz, or compa rable performance on 440Mhz.
I work in security at a facility that uses several mobile business-band radios and I'd like to experiment with adding on a few HT's... They'd at least be good for testing the radios if I can't convice management to get a new license covering the portables....
Preferred: NYC or Albany, NY area sellers, or COD. $100 or less.
PL tones a plus, but not mandatory.
sf3362@alpha1.albany.edu
Thanks!

1564. Light weight Battry Charger ?

Newsgroup: rec.radio.amateur.equipment

Does any body know on any lightweight fast NiCad battry chargers which can be carried in a small rucksack? I am planning to go for a walk in the Welsh hills and I would like to have my dual bander with me for emergencies. I hope to charge the battries when I get to a civilised place. My slow charger takes about 16 Hours to charge and even then the battry is not capable of delivering more than 2 Watts.

Any Ideas?

1566. FT530-Can't get Airband...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: al bolton <al@boltons.demon.co.uk>
Message-ID: <823033405snz@boltons.demon.co.uk>
Source record: 206412

Hello,

I've got an FT530 which has the following coverage:

130-180MHz
400-500MHz
800-950MHz

AM and FM are available. Now according to all the posts I've read (plus all the FTP sites I've visited) the set SHOULD be able to receive:

110-180MHz
300-500MHz
800-950MHz

But it's missing airband and the 300-400MHz section. Does anyone else have experience of this? The usual mod involving pad 13 and removing solder has been done. All I can think of is that certain "varieties" of the 530 have more limited coverage! It is a European model, with 1750Hz toneburst BUT when the CPU is reset, 70cms repeater offset reverts to 7.6MHz, not the 1.6MHz we use in the UK! Also, when following the manual to change the repeater offset, it should be possible to confirm the new offset you have entered by pressing the PTT...not on mine, it's necessary to press RPT again to input the new value...

Any info, observations and general chit-chat about the FT530 gratefully welcomed!
---
al bolton, UK.

1567. IC-706 AM mode

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: "Carmine M. Iannace" <iannace@bu.edu>
Message-ID: <310E2DC1.2B62@bu.edu>
Source record: 206413

I am thinking of purchasing the IC-706. My concern is that its AM transmit mode suffers from the same "downward" modulation characteristic that the IC-735 exhibits. In short, when you adjust the the IC-735 for AM transmit(about 25 or 30 watts carrier if the PEP output of the final is about 100 watts) the output lessens as you apply audio to the carrier as opposed to increasing as is usually the case on Kenwood and Yaesu tranceivers(and on AM broadcast transmitters).

If someone could try their IC-706 on AM to see if this characteristic appears I would be very appreciative. Also, does the radio have a computer control connector?

1568. Help! My IC2340H just turned into a single band 2M!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-30 00:00:00 UTC
From: keith@unm.edu
Message-ID: <4emfsj$8m06@musca.unm.edu>
Source record: 206414

Subject pretty much says it all. Turned on my radio (Icom 2340H) the other day and the 440 part of it is gone! Bottom half of screen completely blank. Pressing the tuning button gets me a "boop", but holding it in does not cause the second beep which it gives to signal sub band operation. I've disconnected it completely from the power hoping it would somehow remember that it's supposed to be a dual band. No luck. And of course I've opened it up so sending it back is not an option. Has anyone else had this problem, or have any clue what to do? The 2M part of it seems to work flawlessly. Also- I've never used the 440 out of band- in fact, you could count on one hand the number of times I've even used that half of the radio. It's almost as if the radio decided that I didn't really need a dual band, and just eliminated it for simplicity. Email or post, this is the first radio I've bought new, and I would VERY much like it fixed.

Hmmm... If you can buy a new R9000 (since you are in a business that will
allow you to do so), then you can get an un-restricted R-7100.

Me, I'm lucky. I have an older R-7100, full coverage! (No, it's *not* for
sale!!) :-)

Hi Allen, I am just about ready to place a Argo 556 for sale.
The rig is a low power version of the current production Scout, except 5 watts out. Comes with several modules, and a slight problem. On CW all OK, on SSB, small amount of side tone comes out of speaker. This is not heard on the transmit audio, but it is still there. I use a keyer with a builtin sidetone, and have turned this down, but it is there never the less. I will ship for $325, with all the modules. Call me if you are interested in it. Frank Work 708-924-1600.

rc-96 repeater controller. This is one of the best controllers available. Original cost was over $1700, about two years ago. It has voice (male and female), excellent autopatch, 200 autodial slots, can be controlled from the phone or a separate receiver, can have another remote receiver, and lots lots more. This is a sweet controller. It works perfectly. It is currently in use in the San Francisco Bay area so you can hear it work, or we could dial it up and you could play with it over the phone. Anyway, If you are interested give me a call. I'm guessing the price will end up being below $1000, but it depends on interest. Talk to you soon

I recently acquired a gem: a Siemens (German) HF receiver covering 1.5 to 30 MHz; about half the tubes are nuvistors the rest are minis; it seems to use a Barlow-Wadley type circuit, as you have to set a 0.1 Mhz dials, and then tune up from the lower setting to your freq (up to 100 kHz). Recent enough to have upper/lower sideband switch, three filters, and other goodies. It's in good shape but inoperative. I'd date it about 53-58; it has influence of both Racal RA-17 and Collins R-388 in it, to judge by layout. Subasssemblies are silver-plated.
Does anyone have a service manual or other info on where I could get a manual, or get it serviced? (I'm in Germany and UK a lot on business).

The Raymond Sarrio Company's Ham Radio WWW site is proud to announce a FREE Ham Radio classified advertising page at http://www.csz.com/sarrio.html. This new classified page will allow Hams to find equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear you'er interested in, you are also provided with easy point-and-click e-mail access, directly to the Ham that listed the item.

For those Hams with gear to sell, take note! there is NO charge to list your equipment within Ham Classifieds, and there will be no posting time delays. Your posting(s) will go on-line in our classified search engine in about 1 hour. All you need do is fill out a simple forms page, and upon its (point-and-click) submission your "For Sale" classified is immediately on-line.

I will be purging the classified listings initially, about once every month, but that timeline will shorten as our classified numbers grow.

Give it a try, and let me know how you like it (we are still beta testing)

Markus,

One vendor you might want to try is "KJI Electronics" located in Verona,
N. J. Gene, K2KJI is reliable and his prices are quite comparable to the
mail order houses. He is open evenings and during the days on weekends.
Give him a call at (201) 239-4389.

: I got a Yaesu FT 767 GX, with 144 Mhz unit. It's a good rig, expecially for
: The 2m unit works till 145.999.
: My question is: how to extend till 147.999 ?
: The same problem is on the other unit (430 Mhz)!

There is a "mod" to take care of your 2M problem on the QRZ ftp site. After a reset, the 2M module defaults to that Japanese 2M band (144-146MHz). To reset it to US 2M, you have to turn the backup switch off and hold down the "2" key on the keypad while turning the rig on. The 430 module only supports 430-440, if you want to use the upper half of 70cm, you have to replace the module with the 440-450 one.

: It's also possible to extend TX capabilities ?

There is a switch you can flip inside the rig to make it xmit pretty much anywhere on HF. Again, the actual mod is on the QRZ site.

Incidentally, I'm looking for a 6M module for my 767, if anyone has one they'd like to part with.

Gary --

You and I have had some spirited discussions over the last few months in which we have debated the fine points of design and I've respected your point of view and debated it as one pro to another. In the last couple of days I have seen some stuff from you that just isn't what I've come to expect from you as an old-time professional in this trade and I'll just shine it on as a bad hair week.

Only to say that the rest of your reply to this post isn't close to the truth and we'll talk about it in the newsgroup later.

Carmine,

Yes the ICOM 706 uses a very low level AM modulation, where the carrier is 40 watts and the audio is subtracted from the carrier to make a modulation enevolpe. Most ICOMs are SSB radios first.

The 706 does indeed have the CI-V port with a new higher speed of 19,200 available now for computer to radio data linking. the entire CI-V command set for the IC-706 is also published in the 706 operators manaul.

I wonder if someone can help me with data on SRFH1900 wich is a final
transistor in REALISTIC HTX-202. I need to find a substitute for that one.
Another problem is a final device in ALINCO DJ-160. It is marked as

M57796H
05SJ

What that one can be substituted with. What is the data for that one.
You see, knowing data for both I will probably be able to locate Russian
equivalent.
And finally does anybody know of www site or other type of server were one
can search for particular electronic part and retrive tech data or get
to know where that part can be obtained.

Hi,

Now that my 2/70 hand held has just packed up I was thinking about getting a ssb rig. My first problem is what frequency to get (i'm only a B license (above 30 Mhz only), and the second is what rig ?

I was hoping to maybe work some dx, so I was thinking about 6m, would I find much out there (my qth is 12 miles from Gatwick airport (in a valley :{)).

To get the most out of my signal (I can't use 2 much power as I live in a housing estate), I was thinking of using a beam, would this be the best bet ??

Sorry if these questions sound daft, but i've only ever used ssb at JOTA.

Andy, g7ueh

(before anyone suggests it, i am 'slowly' learning morse, but i need something to play with in the mean time !!!)

Please be aware! Do not shop at Barry Electronics in Manhattan. They
charge the highest prices in United States and cheat customers from
foreign countries. Sorry to say that other than Barry Electronic, there
are really no other ham stores in this area. Most people do all their
ham shopping through the mail.

1622. Need CHEAP 440 Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1996-01-31 00:00:00 UTC
From: n9mxt1@aol.com
Message-ID: <4engma$i3h@newsbf02.news.aol.com>
Source record: 206440

Hello,
I am going to be running a DX/CLUSTER Node... and currently I have 1 VHF 2M radio and a dual band mobile 2M/70cm. Well, the problem I have is I don't want to use the dual band for the node cause it will take over one end of the band and so, the other band will just be a waist cause I can't transmitt on 2 bands at once.. So, I am needing a CHEAP... I MEAN CHEAP 440 radio could be 1 channel programmable or CRSYTAL I don't care...the only care I have is I need it programmed for 430.0500 MHz or crsytalized at 430.0500 and at least 10watts.

Anyone have a 440 radio that can will go to 430.0500?? Also, need the wiring diagram for the mic so that I can wire my TNC to it!

Looking into spending only about $50-70...

Let me know if you have anything.... Thanks N9MXT1 - Jeffrey
N9MXT - Jeffrey

1623. Re: IC706 RELAY

Looking at the schematic, I see several relays. Of course there are the
BP relays and the off/on relay but which one actually puts the rig in
transmitt mode or are there more than one perhaps?

> voice signal from Canada to Africa !!

An interesting point of view. First, electromagnetic "radiation" generated by radio transmitters is quite different from radiation generated by radioactive nuclear processes; it's not the same thing at all. Second, amateur transmitters are limited to a maximum power of 1000 watts; most operate at 100 watts or less. This is completely insignificant compared to commercial and government radio, tv and radar transmitters which typically generate 50,000 to 5,000,000 watts or more. Third, there is no conclusive evidence linking radio emissions to cancer.

>...what about the catastrophic mess thats done to our television and radio
> reception.

Cases of broadcast interference are now quite rare, and are frequently the fault of inexpensive radio and tv recievers whose designers omitted even the most rudimentary filtering as an economy measure. In most cases, a simple, inexpensive add-on filter completely eliminates any interference with no noticable degredation to the picture or audio.

> You can be sure that a lot of these scoundrels
> build homemade equipment in the darkness of their basements that
> exceed the rules of society...

Our licenses, which we earned by passing rigorous exams on radio theory and regulations grant us the right to build transmitters if we wish. In this day and age, however, such homemade equipment is quite rare; most hams use commercially built transmitters. In any case, there are rules concerning power levels and spectral purity to which even home-built transmitters must adhere.

Exposure to radio energy is a legimitate health concern, although not all the evidence is in yet. Hams do much good in the world, providing emergency communictions in disasters that disable telephone and other commercial communications systems. You should try to learn more about ham radio and the issues involved before being so critical.

I've always wondered about using 1/2 or 3/4 inch copper water pipe as my ground rod feed. It is plenty heavy enough, and I could "plumb" it right up to my workbench from outside. All the connections would of course be soldered, and my final connection to the ground rod could also be friction fit, then soldered (using my two gas torch).

Anyone see any problems with this idea? I'm anxious to try it as soon as the ground thaws out a little. My #10 ground wire just isn't cutting it rf wise. What do you folks think?

Thanks

>And at least it didn't drift, the Clegg did. It was certainly a novel
>radio for its time, but not something I'd want to put back on the air
>today.

Hi all!

I have also owned the Clegg FM-27B and reflect the same problems with
its spurious output. I also had severe intermod and overload promlems
on receive, as well. It was a novelty radio to own, though, in a day
when most radios were crystal controlled and had only 6 to 12 channels.
If I remember correctly, the Clegg also was one of the few that put
out a full 25 watts in a day when 10 watts was the norm for most rigs.

As far as the Regency, I have never owned an HR-2, but I still own an
HR-6, 6 meter rig. Those radios have the most un-stable transmitter I
have ever seen. You can keep the spurs down if you tune the transmitter
on the frequency you intend to use most, into the antenna you will be
using. Don't change frequencies, though, because you will throw spurs
all over the band!

I operate on 52.525 Mhz with this radio, and if my mobile antenna gets
wet, causing the SWR to rise, The transmitter goes nuts and I start to
bring up a repeater that has its input on 51.80, almost 2 miles away!
Now thats a sloppy transmitter!!!

I would like to see more stories relating to the classic radios going back
to the days when repeaters were just becoming popular----back in the
days when you were lucky to have 10 watts, a Ringo, and 6 channels.
It would be much better reading than all of the mud that is being slung
back and forth on this newsgroup!

Sound like an interesting project. However, transceivers capable of operating on this frequency are available in such profusion and at such low cost that one wonders why you are designing one from scratch. Do you have some special needs that aren't provided for in commercial offerings?

Disagree - I have been op on 6m for the past 2 years with only 750mW and have worked most European and Near Eastern countries. Working DX is an *art* and does not require loads of power, but perhaps a fair bit of patience. The rewards are inversely proportional to the EIRP!

David:

I did the "wide-band" mod on my TH-79A(D), I originally did the
"Mars/CAP" mod by cutting the green wire under the CTCSS decoder.
When I did the wide-band mod, I had to put the green wire. The only
thing that was different than the TH-79A, was that the VFO only went
to 470 rather than 512. Kenwood changed someting in the AD that made
it this way oh well. I have a full 800mhz scanner anyway. Also, I
wrote Clayton a letter via snail mail and via e-mail and did not
recieve a response from either so I am assuming that the version "2.0"
is not out. I may make a mod sheet myself and write down my
expieriences with the 79.

Six is becoming popular, but due to the current state of the sunspot cycle you won't find much beyond local activity except during the infrequent band openings. *Then* it can get real busy. But if you're going to restrict yourself to one VHF+ band, I'd think seriously about a 70cm or 2m SSB rig before I'd set up for 6m. That's because there are many more operators, and more enhanced propagation modes to explore, on those bands. Your "dx" won't be global in scope (unless you go for EME), but it will be more frequent and more hectic as you chase tropo, aurora, and satellites.

However, if you're patient, a 3 element beam and a 100 watts on 6 meters can give you globe spanning results when the band does open. Meteor scatter also works better here than on 2 meters. In 4 or 5 years when the sunspot cycle comes around, 6 will be open to somewhere in the world almost daily.

I think that would work great Ed, but remember the thickness doesn't matter very much as long as it is more than a few thousandths of an inch thick. That's why flat copper foil is so good. It's very wide and smooth!

1648. QSK Cookoff

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-01 00:00:00 UTC
From: n4lq@iglou.com
Message-ID: <DM3Lzv.A4z@iglou.com>
Source record: 206266

Last night we ran a QSK cookoff to determin which of three transceivers
has the fastest QSK. The rigs were:
Kenwood TS-940S
TenTec Triton IV 540
Icom IC-706

Dots were sent at various speeds from the rig being tested while one dot
was sent by the breaking station. If the dot was heard, transmission was
stopped immediately to acknowledge the break. This was done multiple
times to eliminate the chance of error. Results were:

TS-940s Maximum speed was aprox. 30wpm.
Triton IV 25wpm
IC-706.....60wpm plus. It's keyer won't go any faster.

So even though the little 706 does chop it's dots, the recovery time on
the receiver must be oustandingly fast.

The Triton IV had the worst qsk even though it has better keying
reproduction than the 706. Recovery thime seems to be a problem. Even at
25 wpm it was difficult to hear the breaking dot.

The 706's receiver sounded like it was wide open even at 60 wpm and could
go much faster.

Try adding the PAC Electronics Notch Filter, for $ 68 bucks the noise is dramatically reduced for the wide open front end radios like the Kenwood TM 733A. 73. Mike W7CFL

1652. Re: In ear mic/speaker combo

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-01 00:00:00 UTC
From: mreising@aol.com
Message-ID: <4eqkcf$k81@newsbf02.news.aol.com>
Source record: 206270

I have purchased and used the Telex Ear-Mic adn they are a quality piece of equipment with excellent sound when properly adjusted. We used these when wearing self contained breathing aparatus for haz mat work. they cost ~200 to ~250 dollars if I remember correctly. I have not had any experience with the lower cost units such as the Ear Talk but the concept is valid. For the unit to work well you need to have a good fit in your ear, either a custom molded plug or for use between many persons a foam plug (hearing protecter plugs) with a hole punched thru the center. Telex makes an adaptor that has a small hollow post fitted to the ear phone over which you slip the foam plug. this provides a good seal allowing the earphone to pick up your voice. If you have the sensitivity set too high you will also pick up local crowd noise etc.

Hope this helps.

From: mreising@aol.com
Message-ID: <4eqkqm$kdk@newsbf02.news.aol.com>
Source record: 206271

I recently bought a DX70T and it is a good radio (replaced a TS140 in my mobile) however the separation cable is limited to 5 feet. I made a 5 foot extension for the cable but Alinco does not recommend use of cables longer than 5 feet due to possible loss of data integrity between the CPU in the control head and the radio. I'll post additional comments after I have used my extended cable for a while.

A couple friends have the IC706 and it is a good radio also. My only complaint with that radio is that 6 meters uses the HF port, I would have preferred it on the VHF (2 meter) port. The main reason I did not buy the radio was budgetary.

I want to get a new 2 meter or 146/450 mobile. I want small size, intuitive ease of use, and a bright display with large numbers, since my eyes aren't what they used to be. I've read the poop sheets for the Icom, Kenwood, and Yaesu radios, I've seen them, and have narrowed it down to the Icom 281H ($379 locally) or the Kenwood 733A ($585 - $85 rebate). In your experience, any cons or special pros for these rigs? Do you have any better recommendations? I've looked for reviews, but CQ didn't have any. How 'bout QST? Is there a ham magazine nowdays especially for VHF/UHF equipment? Is there a place to buy with better prices than the others?

>would appreciate any comments from happy or unhappy users.
>I like having 6 meters (IC-736), but also want 12V operation
>(IC-738) for portable use. Any comments?

I have a IC-736 and have been quite pleased with it. Some of the older models
have the 30HZ off defect which is easliy corrected by a mod on the BARC archives.
The review in QST is quite accurate. The tuner works quite well. You will probably
not want to use the provided hand mic, since it is not that good, probably by
design. I have the ICOM SM-8, and it works quite well. I get a lot of good reports
when I am running digital modes. People often say the sigs sound good when
on CW. The notch filter is very good, but the noise blanker isnt worth much.
I would buy the radio again. If you plan to go mobile, buy a ic-706!

: It's like none of the engineers did a complete job at any company, but I
: think Ten Tec is the best overall in all aspects.

Perhaps the newer TenTec rigs have faster recovery but the old Triton stunk. However, it has no phase noise and I could listen to it all day without tireing. The ICom roars like a freight train but is still better than the 940. It's a shame, so close yet so far!

Dan Rockhold, AB7AS and Mark Sunders, KJ7BS are looking for a location in North Dakota from which to operate AB7AS during the 1996 ARRL November Sweepstakes.

If you are not a contester or know someone who is not a contester, and would be agreeable to having 2 guest operators for the contest, please respond!

We are in the planning stages for this expedition, but we need to get a location very soon.

We are interested in the station equipment, especially the antennas. We can bring out own radios, power supplies, computers and interfaces, if necessary. However, we can not bring the antenna farm, too.

The station owner is more than welcome to join us in out endevor, or just watch, keep up awake, or what ever. WE WANT YOU TO BE PART OF OUR TEAM. Our goal is NOT to win the contest, but to have a good time and gain new operating skills. From Dan's home QTH in Phoenix, AZ, we got all but 7 sections in the 1995 November Sweepstakes. We do have a lot of fun with this hobby.

If you are interested, or know someone who is interested, please contact me or Dan at one of the addresses below.

Is that using some public key encryption technique?
If not, what is preventing the malicious from cloning one of the
apparently valid codes?

Also, what is preventing the malicious user from just keying up over
other people's transmissions, thus rendering the repeater useless?

Hmmm... it looks like HDTP (or equivalent of the FCC) does not put
out such drastic sanctions.
Normally one will lose the license for a year or so, and one could get
a fine of maybe $500.

This does not seem to stop some people... when you have been reading the
BBSes, you can see that the wellknown person that causes havoc on the
local packet network is still active. He is fully known by name,
ex-callsign, and address.
(he just uses callsigns of other people, mainly VERON officials, to
post offensive messages. he was also active on the phone repeater sometime,
transmitting over those same people, but I think he has lost interest in that)

From: Pete Dziomba <n2mci@mhv.net>
Message-ID: <4ep2n2$98u@over.mhv.net>
Source record: 206327

That FM board was designed with descrite transistors and other Comp.'s.. Today we have IC's that are Mixers/IF's and Demodulators.. Ie NE602 & CA3089... And if you look at all the outputs of the CA3089 it will provide all of the various outputs that the 551 FM board did.. (S-Meter, Tuning-meter, & Squelch).. The modultor is just a basic 9.115 Mhz FM Mod.. The ARRL handbook has sereral examples of all these basic blocks.. They shared a common IF (9.115 MHz) point and used Diodes to switch between Trans/Rcv... I'll admit there will need to be a little tweeking to get all of the outputs at the exact level but that's true with any homebrew project... 73's Pete N2MCI

1668. Repeater Controllers

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-01 00:00:00 UTC
From: asniffen@computer.net
Message-ID: <4ep8sa$809@news.computer.net>
Source record: 206328

Hi all,

I am looking for information on repeater controllers.

We are currently using an ACC model 850 controller which we have had on line for approximately 6 years. We would like to purchase a comparable unit which would be interchangeable with the 850 without having to do a major rewiring and/or audio level setting job.

Basically we want 2 completely interchangeable controllers so that one may be used to backup the other with a minimized amount of tweaking. The features would have to be similar, although I realize that identical features is not realistic.

Obviously, this would have been a simple purchase had ACC not gone out of business. But, so it goes.

Does anyone have any experience and/or suggestions? Please e mail me with any info or post it here.

Thanks!!

Steve, That was my point. If manufacturers do the keying correctly, it
detracts from the receive time. If they do sloppy keying, the receive time
is better.

What ICOM really needs to do is re-write the software. They need to add a
weight control and extend the tailing edge to match the leading edge
closer.

Your test is only of one aspect of the problem, you also should test the
external PA control line. In that case you will find some Kenwoods really
stink.

It's like none of the engineers did a complete job at any company, but I think Ten Tec is the best overall in all aspects.

>I *hate* the microphone control system. (snip)

Like Gary, I hated the 'Mr. Potato Head' microphone on the 8500. I think there are knobs and/or buttons on every surface of the mic.. I noticed last fall that Yeasu had 2 versions of the rig. In addition to 'Mr. PH', they have a model that is more similar to a lighted DTMF mic. with a few extra buttons below the keypad, up/down buttons on the top side, and a small 'volume' control dial. (dial is switchable bewteen 'bands' and also between vol & sqw) The keypad/control layout is very similar to the FT-51 handheld unit - function + DTMF key for 'frequent' controls and a menu system for less-used features. I really like this version - setting up the memories & features with a PC is very handy (especially when planning long trips) and the alpha display is extra nice when traveling. I use the seperation kit for the FT-5200 (1/2 price of 8500 kit) for the display cable and added an external speaker and mic cable.

1679. [ANN] New version of MacGPS available

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-01 00:00:00 UTC
From: lwjames@ix.netcom.com
Message-ID: <4eqldf$ck8@reader2.ix.netcom.com>
Source record: 206339

A new release of MacGPS is now available. MacGPS is free software which allows transfer of waypoint, routes and track logs between a Garmin GPS receiver and a Macintosh computer. New features include a rendered topographic world globe showing your current location. There are also some bug fixes, so everyone who uses MacGPS should get this new version. Download it from:

ftp://mirrors.aol.com/pub/info-mac/sci/larrys-mac-gps-04b8.hqx

or the info-mac mirror site which is closest to you. After you download the file, drop it on StuffIt Expander to extract the application.

Hi!

I own a TM-2570A mobile transceiver by Kenwood and I would like to know
if there is a CTCSS decoder option for it. I have the CTCSS encoder.
If there is one, I would like to know its model and where can I get it
from.

Many thanks!

RE:

>I've always wondered about using 1/2 or 3/4 inch copper water pipe as my ground rod feed. It is plenty heavy enough, and I could "plumb" it right up to my workbench from outside. All the connections would of course be soldered, and my final connection to the ground rod could also be friction fit, then soldered (using my two gas torch).
<

Ed:

I've been using this for about a year. It seems to work pretty well. The 3/4 " copper pipe just fits over a standard 5/ 8 " ground rod.

A slit in the end and a small hose clamp gives a good connection. Soldering would be even better.

In the shack, the end is easily flattened for whatever length. This facilitates easy drilling for mechanical connections. Mine is connected directly to an Alpha-Delta Transi-Trap. Heating that much copper for soldering may be beyond some persons soldering iron. (mine)

An extended flattened length could provide a ground bus.

Well 6m is good in the summer with sporadic 'e' but e's each day
become a bit boring especially after your log fills up with italians
and balkan area people. When the DX is around you might need a bit of
power to break the pile up.....and when there are no 'e's about it's
as dead as a dodo. Until conditions improve I'd leave it as your main
band.

For my money I'd go for 2m, much more activity especially in the
South, up here in the sticks it's quiet. But you could get a rig such
as an IC251e (around 300UKP) and add an amplifier to take it beyond
the 10 watts it normally gives out. For example, with 70 watts and a
9ele yagi I managed to work down to Reading from Edinburgh last night.
Ok it was a prearranged sked but that appears to be the only way to
get a long distance qso these days.......

Cheers,

1692. Kenwood TM-241A erratic display

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-01 00:00:00 UTC
From: agia@ix.netcom.com
Message-ID: <4er7cn$q4u@ixnews7.ix.netcom.com>
Source record: 206352

Has anyone had a problem with an erratic display on the Kenwood TM-241A mobile 2M radio ?

The radio has an intermittent problem with the LCD displaying garbage. The radio continues to receive/transmit fine. The internal lithium battery measures at 3.25V, so I assume it is fine. Resetting the radio's microprocessor by holding the MR button down during power up does not cure the problem.

I have taken the radio apart, re-soldered connections, re-seated the display, etc..., to no avail. I do not have documentation other than what came in the manual. I have heard that if the backup battery voltage is low, this can cause the problem. The battery seems fine to me if the voltage is at 3.25V. It is also soldered down.

Someone mentioned in a recent QST magazine a similar problem but I lost the magazine.

Anyone have any ideas? Please e-mail at: agia@ix.netcom.com

Just bought one myself and have had no problems with it. I did read,
however, that voltage spikes in the dc can cause display malfunctions.
You can fix them, apparently, by resetting the cpu (see instruction
book)

1698. Reducing IC-735 6-meter spurs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: an142028@anon.penet.fi
Message-ID: <150317Z02021996@anon.penet.fi>
Source record: 206158

REDUCING 6-METER SPURS FROM THE ICOM IC-735

Recently, I assembled a Ten-Tec 1208 6-meter Transverter Kit which my XYL had given me for Christmas, and which I planned to use with my Icom IC-735 HF rig to return to 6 meters after a hiatus of about 15 years. The "Blizzard of '96" having rendered outdoor work unpalatable, and roof work downright dangerous because of snow and ice accumulation, I decided to build a simple dipole and install it in the attic. This done, I proceeded to give 6 meters a try - but what a cacophony of in-band spurs greeted my ears!

With the 1208 connected to the dipole, which is located in the attic and about eight feet directly above the shack, tuning across the band from 50.0 to 50.250 (14.0 to 14.250 on the IC-735) revealed a vast array of spurs - some fixed frequency, and some of which "stepped" as the IC-735 was tuned - ranging in amplitude from right at the noise level (about S-2 on the IC-735 S-meter) to S-8. Several of the most prominent in the primary range of interest between 50.025 and 50.225 are listed below:

Frequency (MHz) Amplitude Description
~~~~~~~~~~~~~~~ ~~~~~~~~~ ~~~~~~~~~~~
50.047 S-7 Steady carrier

50.100 S-8 Steady carrier

50.121 S-6 Step (follows
IC-735 tuning)
50.200 S-8 Mixed, steady &
step
50.226 S-6 Step

Although I was able to successfully use the IC-735/1208 combo with the indoor dipole for 16 QSOs in 5 grids during the January VHF Sweepstakes, the presence of such a multiplicity of spurs, at least some of which were apparently emanating from the IC-735 (witness the "step" signals noted in the table above), was deemed unsatisfactory. I therefore proceeded to investigate the nature of the problem and to attempt to determine a solution.

The first thing I noticed was that removing the microphone from the HF rig eliminated many of the spurs and drastically lowered the amplitude of the stronger ones.
~~~~~~~~~~~~~~~

Using a short length of wire as an "antenna," I alternately touched each pin in the chassis connector and discovered that although several pins were "hot" with the spurs, the worst offender was the PTT ground line. Touching a small bypass capacitor between the PTT ground pin and the chassis reduced the amplitude of the spurs several S units.

A word about where the spurs come from: Most are present inside the IC-735, at least some of them are synthesizer-related, and they are conducted between the PLL board and a small auxiliary board mounted behind the front panel adjacent to the mike connector. Signals are carried from this auxiliary board to the mike connector via a small, thin, plastic ribbon with parallel circuit traces on it; the end of this ribbon is soldered to the pins on the back of the mike connector (the ribbon has an eyelet pattern which matches the pin layout on the connector). Needless to say, any signal present on any trace is readily coupled to other traces, and with the microphone plugged in a ready-made "antenna" is available to radiate these spurious signals.

Despite the use of small RF chokes and some bypassing on the auxiliary board, the spurious signal levels audible in the 6-meter band when the antenna is located in the proximity of the IC-735 are quite prominent and annoying. Obviously, mounting the 6-meter antenna outside, high and in the clear and as far away from the IC-735 as practical, will reduce the spurious pickup. Some of the spurs were so strong, however, that I deemed it appropriate to try and reduce the amplitudes as much as possible; if reduced to the point of being a mild annoyance with the antenna only eight feet from the rig, I surmised, then using an outside antenna should render them inconsequential.

Unwilling to immediately make internal modifications, I reconnected the microphone and tried clamping a ferrite RFI choke onto the mike cable adjacent to the connector. The RFI choke consists if two 1" x 1/2" x 1/4" thick pieces of ferrite material, each with a longitudinal semicircular groove in it. Each piece is mounted in a hinged plastic cover and forms half of a clamp which, when placed over a cable and snapped shut, is supposed to reduce RFI leaving the equipment and traveling down the cable. It is intended to be used on personal computers to prevent radiation from keyboard and monitor cables.

The ferrite clamp proved to be something of a disappointment; while it did reduce the amplitude of the spurs, using one clamp only reduced the level about an S unit and using two reduced the level no more than half an S-unit more. Given the amplitude of some of the spurs, I considered

this to be inadequate, and so set about to determine what internal modifications could improve the situation.

I will spare the reader the details of all the measurements and combinations tried, but suffice it to say that internal bypassing is the only way to effectively reduce the spurs to a point where they become barely an annoyance; I was unable to eliminate them entirely. The remainder of this discussion deals with the final modifications as they were incorporated in my IC-735.

To accomplish the internal bypassing, first remove the top and bottom covers of the IC-735 and lay it on its top with the front panel facing to the left. This puts the mike connector on the observer's left and immediately in front. Behind the mike connector is a small, vertically-mounted circuit board, and pointing towards the observer from this board are several small, green RF chokes in approximate vertical alignment. These chokes are, from top to bottom: L8, L7, L6, L5, L4, and L3, and are in-line chokes for the PTT, squelch, UP/DOWN control, +8 vdc, audio output, and microphone "hot" lines, respectively. L2, the microphone return, is located on the same board but on the bottom left as viewed by the observer and is pretty inaccessible.

Since L7 (squelch), L5 (+8 vdc) and L4 (audio output) are not connected to any wires in the mike cable when the standard HM-12 hand mike is used, they can be ignored. This leaves L8 (PTT), L6 (UP/DOWN), and L3 (mike) which could be bypassed. During testing I determined that bypassing these chokes reduced the spur levels as follows (tests performed while monitoring the 50.100 spur):

L8 bypassed: Level reduced from S-7 to S-6
L6 bypassed: Level reduced from S-7 to S-4
L3 bypassed: Level reduced from S-7 to S-6

I also determined that bypassing L2 (mike return) would reduce the spur from S-7 to S-5, and bypassing pin 6 on the mike connector (PTT return, which does not pass through a choke) would reduce the level from S-7 to S-4. L-2 is located such that my soldering iron wouldn't reach it, but pin 6 of the mike connector was barely accessible from behind by *very carefully* reaching in. I therefore determined that I would install three bypass caps: One on pin 6 of the connector (PTT return), one on L8 (PTT), and one on L6 (UP/DOWN). Since bypassing L3 (mike) had only a minimal effect at best, it would be left alone.

The capacitors I chose were all CK05 square ceramic types, but disc ceramics should work just as well. The values I used were 0.1 ufd for bypassing pin 6 of the mike

connector and 0.01 ufd for bypassing L8 and L6.

The RF chokes are easily bypassed, since they are mounted vertically to the board (horizontally to the observer) with the outer-most lead looped back down to the board. Make a small "hook" in one lead of a bypass capacitor (cut the lead length to about 1/4" or so), hook it over the wire of the loop, and tack it with the soldering iron; the other lead of the bypass capacitor should be grounded. Alternate loops have insulating sleeving on them, but as it happens the loops of L8 and L6 (top and third from the top as viewed by an observer with the rig upside down as described) have no sleeving and so the connections are easily made (see the note below regarding the ground connection point).

Connecting to pin 6 of the mike connector is a bit trickier: First, make a small loop in one lead of a capacitor (the lead can be cut to about 3/8" long first), bend the loop 90 degrees, then slip it over the pin. Reach in *VERY* carefully with a small soldering iron (25 watts or less) and "tack" the lead to the pin. ***USE EXTREME CARE NOT TO TOUCH THE PLASTIC RIBBON OR ANY OTHER INTERNAL COMPONENTS OR WIRES!!!***

The free lead of each bypass capacitor should go to chassis ground, and this is easily accomplished by mounting a solder lug under the nearest PC board holddown screw on the large board mounted to the underside of the IC-735. This brass screw is plainly visible on the left front edge of the board (as viewed by the observer with the radio facing left); just remove the screw, lockwasher and flatwasher, slip a lug over the screw shaft, and reinstall the screw with the lug facing toward the rear of the front panel. I used one of the long, tapered lugs. It's easiest if you install the lug *FIRST* before installing any of the bypass caps.

After installing the three bypass capacitors most of the spurs had been reduced to the point of being completely inaudible. Of the strongest of the original spurs, the two at 50.100 and 50.200 are barely audible at the noise level, the synthesizer-derived "step" spurs at 50.121 and 50.225 are no more than S-3 (with an S-2 noise level and the IC-735 preamp turned on), and only the 50.047 steady carrier is unchanged at S-7 (my guess is that this is an external signal; I have a couple on 2 meters from the local TV cable). There are no other spurs of any consequence within the range from 50.100 to 50.225 -oh, perhaps a very faint, almost inaudible remnant in two or three places - but nothing to interfere with weak signal operation. An outside yagi should only make things better.

For those who may be wondering, I actually tried cutting the UP/DOWN line at L6 but it made almost no difference; bypassing is the only thing that really seems to work. Oh, yes, don't forget to ground the IC-735 to your station ground via the rear panel ground jack - the difference between "grounded" and "ungrounded" is about half an S unit (with no bypassing).

Incidentally, the modifications have had no adverse effect on operation of the IC-735, and in fact have made 6-meter operation very pleasurable. I can't wait for that first sporadic E band opening!

If you have questions or comments about the problem, tests, or procedures described, please feel free to drop me an e-mail at pbock@melpar.esys.com or call me at (703) 560-5000 x 2062 (weekdays) or (540) 882-4745 (evenings/weekends).

73,

Paul Bock, K4MSG

1699. Cheap 2m vertical! was: cheap antenna for FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4et2u8$cte@cville-srv.wam.umd.edu>
Source record: 206159

>Hi... I'm a fairly new ham, and want to build a cheap antenna for my
>handheld transceiver (FT-530) to use for packet. I'm going to use a power
>supply and want to get away with using it for packet instead of buying a
>base transceiver.
>
>How do I do it cheaply? Any suggestions or recommendations? Is it easier
>or cheaper to buy something?
>

One of the easiest, cheapest antennas you can ever find requires:

about 8' of stiff #12 wire
one SO-239
four screws, each with a nut

Four holes in the SO-239, each will hold a 19-20" piece of wire
which will be bent downward at a 45 degree angle. These four
are to be at 90 degree angles to each other.

Each screw/nut holds a radial in place, and they can be arranged in
interlocking fashion, much like the flaps of a cardboard box.

The radiator is to be soldered to the center pin of the SO-239.

Mount it, hook up some coax, tune it, and you're on the air with
an antenna for 2m (cut to size for other bands - Amateur Radio Trader
has a measurement chart printed in every issue) for about $5.00.

Not surprisingly, as 440 is roughly a 3rd harmonic of 2m, the 2m
antenna may actually match on 440 as well (mine does).

1701. 'Cubic Communications' MMBX ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: rickcrider@aol.com
Message-ID: <4esl7e$e9n@newsbf02.news.aol.com>
Source record: 206205

In a box lot of 'stuff' I bought at a silent key estate auction I've found an odd little switch box. Approx. 3"x2"x2.5", black, with an SO239 chassis mount connection on the two sides, one marked transmitter, the other marked antenna. The rotating switch selections are marked 'A' (High) through 'G' (Low). (Seven positions) Name and logo on unit indicates 'Cubic Communications' with "MMBX" in large letters. Obviously not an antenna selector. Anyone have one of these or know what it is? Thanks in advance. 73

Hi Andy,

Here in Europe the situation is the following: 6 m becomes very busy during
the summer months, when you will be able to work entire Europe with 10W
or so and a modearte beam. Now in the winter it is quite quiet.

On 2m SSB you may find some activity every weekend, but since your QTH
is in a valley, you may find during band openings that the OM's in better
locations always catch the DX first. This is not so critical for 6 m
sp-E.

On 70 you might also be listening to the noise for most of the time.
the higher up you move in frequency, the more critical becomes you take-off.

My advice: go for 6 or for the lot.

>Connectors present an impedance missmatch, which when placed in a
>constant impedance circuit will create a missmatch loss, not a direct dB
>insertion loss. In other words the missmatch loss is a function of the
>impedances involved.

Ah, would you care to present the equations involved?

If you do, you'll see that the "missmatch" (sic) loss is due to the
number of trips the exponentially decaying reflected signal makes
on the line section multiplied (with appropriate scaling) by the
line loss. There's a nice chart in the ARRL Handbook that will save
you the math. For low insertion loss line sections, the additional
mismatch loss is insignificant if the mismatch is under about 10:1.
The maximum mismatch in UHF series connectors is about 2:1. And the
line sections they represent are *very* short, and thus pretty low
insertion loss.

>One could find a coaxial line impedance at which
>the PL259/SO239 impedance is very close at any given frequency, and thus
>the missmatch loss would be very low, even at a high frequency.

Which impedance, the one presented by the ring and pin of the connector,
or the one presented by the body of the connector, or the one presented
between the inner and the hood on the back side of a SO239? They are all
different. That's why the UHF series connectors are non-constant impedance.
It's not just that they aren't 50 ohms, they aren't of course, but that
they aren't any *one* impedance.

Gary

Here's what a local repeater club in So. Cal. did:

-Changed the status of their repeater from 'open' to 'private', so that only club members are 'supposed' to use it.

-Got a restraining order prohibiting the undesired user from using the repeater.

The restraining order was enforced & the undesired user was forced off the repeater, along with lots of 'good' non-member users.

1720. Help with: KYOKUTO 2mtr rig???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: "Thomas W. Castle" <afn17891@afn.org>
Message-ID: <Pine.A32.3.91.960202030202.51931A-100000@freenet2.freenet.ufl.edu>
Source record: 206224

Hi Tom here: I have run into a unusual radio.... It is a -
KYOKUTO FM 144-10SX II. How is that for a name full? It is a older
2 meter FM rig, no bells an whistles. It has digital display, but not
direct entry. It uses a Mhz switch for each band 144, 145, 146 & 147;
a twin VFO knob setup for 100 an 10's changing and a 5Khz in/out knob.

The unit works fine on Rx 144 - 148Mhz. It will only Tx on 146 & 147Mhz.
The unit does not "click" the relay on 144 or 145Mhz, it will Tx on 145
Mhz if I dial it down to 146.000 and use "-" offset. It will Tx at 145.4
as expected... Yet if dialed in on Simplex to any 145 freq, even on I just
saw on my freq counter; it won't Tx period...

If anyone has a schematic or "Heaven forbid" a service manual, that is
readable or will at least copy the schematic an tech align. data: I
would be glad to pay for the cost of reproduction an mailing costs or
if they don't need it any more, I would buy it...

They may e-mail me at my address at UF or via packet as "KD4QHH@K4DPZ
#GNVL.Fl.USA.NA. This way we can get together on what they have an
where to send it... My address is good in the callbook.

Tnx for any help in advance..!

De Tom a.k.a. KD4QHH

BTW> The unit works great in the areas its working in 146 - 148.Mhz,
I just think this would make a decent packet rig.... I just need to
get it working in that freq range...

You didn't say if the transformer is the high voltage or the filament
& bias. The respective part numbers are 54-237 & 54-238. According to
QST, Heath still supplies parts. Call the Heath Order Desk at
616-925-5899/4914. Let me know how you come out.

Source record: 206233

Hello all, I'd like to set up a personal phone patch on my phone line so I make calls whereever I am in my city with a handi-talki. I'd like to know if anyone out here has something like this set up. Plus I'd like to be able to be notified over the air with a pre-recorded message, tone, or something that I have an incoming call. Something like that. If anyone is running a setup like this, please email me directly and tell me what equip you're running and about how much it cost. I'd like to set something up, but I haven't actually but any equipment as of yet since I just got my advanced certificate a little while ago.

Thanks,

|yler Gunn (tgunn@mbnet.mb.ca)

1730. Power/volume knob on PCS-4000

Message-ID: <4eske4$kd@axl02it.ntc.nokia.com>
Source record: 206235

GD OM / YL

There has been discussion about the 706's microphone,
and that it is not enough sensitive. I discussed
with my friend who is working with audio-things and
he told this.

"So, I think that this mic is Noise Cancelling type.
And these microphone elements are designed so that
when voices are comeing from far, they are neutralizing
each others (element is causing phaseshift).
Because this principle, you have to keep microphone very
near to your mouth ! Otherwise mic element is "noise cancelling"
also your own voice."

I tested that, and I noticed that I really have to speak
very near! Usually when I use mics, I keep mic
quite far. And I use more Mic gain to get good audio.
But this is not possible anymore with 706 mic. So I have to
change my old habits and put the mic directly to the front of
my mouse.

And second thing:

Could anyone tell me how much the 500 Hz Cw filter
and remote cable costs in USA. Here in Finland
500 Hz filter= over 130 $ and cable = 70 $!! :(:(

From: johng@emerald.net.com
Message-ID: <4etc8o$m0h@unet.net.com>
Source record: 206237

We have a company station with a Kenwood TS-440S(AT).
We Recently bought a PK-232MBX and I was trying to
bring things up last night when it occured to me I don't
know how to limmit the power output of the rig.

I went through the manual and read about the 'CAR' knob,
which the manual states limits the carrier during
AM transmissions.

I could not, however, find anything that would let
me adjust the RF output while in LSB mode.
(Note, we couldn't find a 13 pin din connector
to use the aux port on the 440, so we are going
in through the mic jack).

Does anyone know if it's possible to lower the power
output of this rig? I read a paragraph that said ' when in
FSK mode a key down time of 60 minutes requires a cool
down of 30 minutes' (or words to that effect). This leads
me to believe that it is not possible to turn the thing down!

Any comments?

I found the advertisement of "Struthers RF Directional Wattmeter"
on HTYS.
It was advertised that
Factory Boxed brand new
With 3 plug-in elements for 2-1,000MHz & 0-5,000w
With Carrying/storage case
$200 with free shipping(ofcourse in ConUS)
Not exact type number of the product was mentioned.

I've never heard either the Manufacture Struthers or their RF
wattmeter. I already have one Bird directional Watmeter but only
one slug for 0-30MHz 1kw.

Does anyone use this wattmeter? How about the quality(accuracy)
compared with Bird wattmeter? Your suggestions/informations will
be greatly appreciated.

Message-ID: <4erlre$58e@mtv.acsys.com>
Source record: 206242

Hi, we're looking for beta testers to try out our new software for programming the Yaesu FT-51R handheld transceiver. Please see the following Web page for more information:

http://www.acsys.com

We're also holding a contest for the best name of this software; we haven't come up with a good name yet. The name should represent our goals for the software: it should program a variety of radios, it should support command line and screen oriented interfaces, and it should run on multiple platforms. Send us your idea for a name for our software. If we use it, you'll receive a free copy of the software and free updates for a full year.

thanks,
dave sims

>apparently valid codes?
>

Every radio has a "unique" pattern when you key it (due to differences
in the components etc), this pattern can be used to identify a radio.
There is no encrypted signal or anything that fancy.

One of the repeaters that I used to monitor had a tx-id system on it,
if you ker-chunked the repeater more than 3 times in a 5-10 minute
period, it would lock you out for a couple of days. It was also used
to track stolen equipment (you had your tx "fingerprinted", then when
the tx got stolen, you just let one of the ops know and the repeater
would advise you when it heard that tx (if it heard it)). They, also,
could (and did) blacklist certain radios.

>Also, what is preventing the malicious user from just keying up over
>other people's transmissions, thus rendering the repeater useless?
>

This is one of the weaknesses of the system, another is changing the
rig, or swapping a couple of components in the tx (changing some of
the resistors/caps is usually enough).

If someone really wants to get around the system they will.

regards,
Dean.

Rich KA9MAB writes that he is interested in trading in his
Icom 737A for one of the small mobile HF rigs:

>planning to trade for either a Icom 706, Alinco DX-70T
>or Yaesu FT-900AT.
>

Hi Rich,

I have been using an Alinco DX-70 for about 6 months. I ALSO borrowed an Icom 706 from a buddy for the past month & had a Yaesu FT-890 which is a slightly older version of the FT-900 for about 4 yrs. Perhaps I can offer some user input...though I'm afraid that I dont have a side-by-side super techno analysis for you.

I'm a contester and DX'er --mostly CW, so here is my opinion (mileage may vary, tax title and license not included, less cashback and MSRP discount, batteries sold separately)

From my standpoint, the Icom 706 is a good all around rig for mobile use. It covers the entire HF, 6, plus 2 meter band. However, I notice the radio interface (ie the display, memory function, multiple menu display) is not so great if driving in a car. Just too many multi-function buttons --it would make driving a bit dangerous IMO. On the air performance is superb though. Have not used it mobile so I cant validate the concern for safety in the mobile environment. The detachable faceplate is nice, as is the cw keyer and built in VSWR meter. It can make for a really "slick" HF + VHF mobile installation and really avoids the clutter of extra VHF radio's etc. This one is ideal if you are at home in a Mazda RX-7 type instead of a Ford F-150 supercab. Would I buy an IC-706....yep, next time I go to Singapore I think so. Just too neat a rig to not have one.

The Alinco DX70 is a splendid rig, covering HF and six meters. No 2 meters on this rig, but the best features are simplicity of operation. It is easier to use than the Icom...something I tend to look for in a mobile HF station. The audio from the Alinco gets rave reviews..same can nott be said of the Icom or Yeasu. But, the RX in the Alinco is a bit puny compared to the Yaseu 890. It is about the same as the Icom--both Alinco and Yaesu rigs suffer from out of band selectivity when being hit with high powered shortwave broadcast band interference. The Alinco does include some better selectivity by way of included filters...but the Icom does not include any narrow CW or SSB filters but either a SSB or CW filter may be added for about a hundred extra bucks. The Alinco includes

narrow filters as "standard" equipment. The user interface of the Alinco is superb, offering a multi step amber-on-black display. Only missing items are no built in cw keyer (I'm a CW man) and no VSWR meter making mobileers add an outboard meter. I've used it as a spotting rig in contests, and it can run DX Q's as well as any other rig.

I find the FT-890 to be the best of the lot for just plain performance excluding aesthetics or operator interface while mobile. It has a stout transmitter, built in VSWR and CW keyer, I put a 250 Hz CW filter in it, and it has a built in auto antenna tuner. However, the cost is size...it is about 3X the size of the Icom or the Alinco. The FT-900 has the detachable face plate, so this might be the route to go, but still not all controls are adjustable from the detachable panel. Also, the FT-900 has an LCD display but the 890 was amber "reverse LCD" which makes it impossible to read in direct sunlight. Audio is fine, but you really need the MD1 desk mic to get "great" audio out of the rig. Unfortunately, the FT-890 or 900 do not cover any of the VHF or 6 meter bands. If you are HF only, then no problem. If you want to check out additional action, I'd say go with the Alinco or Icom since the sunspots are making for pretty pathetic bands of late. The rig is fine for a home station...in fact it replaced an ICOM 751A, and I sold an FT-1000 while living in JA since I couldnt justify the cost/performance difference between the 1000 and the little 890 ! Some guys can...I couldnt. So I was pleased with it and "knock on wood" zero problems in 4 years and several dxpeditions later.

In summary, every rig is a compromise. I've yet to find the utlimate in mobile ham rigs. I believe the ICOM comes close, but needs some improvements in the CW end of things and in the user interface. Covering HF+6+2 is a nice plus. The Alinco seems to be the easiest of the lot to master in terms of operation, but lacks a few "must haves" such as VSWR meter. The Yaeus is stout--- I use it when contesting and "hears" as well as an FT-1000. It is not ideal, though, for mobile use due to size and display difficulties. It also lacks the VHF or Six meter coverage.

Hope this helps. Let me know how things turn out and general inputs you get on your query. My guess is that most will vote for the 706...it is the coolest little rig to hit the market since Tempo released their S-1 synthesized 2 meter HT.

Source record: 206248

I own the Alinco DX-70T. It's a super little rig for mobile use. No, it's not as sophisticated as the Icom 706, but it is hundreds of dollars cheaper, and besides, who needs all of the Icom's bells-n-whistles anyway, especially when you are running down the road? The DX-70T puts out a nice honest 100 Watts PEP, has superb audio, and the receive audio is the best I've ever heard in a mobile rig. I don't need an external speaker, for the first time ever! I've used many rigs mobile (TS-130S, FT-757GX, TS-430S, IC-730, HR-2510, HR-2600, HTX-100, Scout 555, converted CB's, etc). ALL of them required an external speaker, except the DX-70T. It is, IMHO, the best buy in a mobile HF rig, especially when you remote it.

Would you be interested in buying another RC 850?

I have one with V 3.8 and know of one other with V3.5 in it (both
have CIB installed...plain front panel)...

I have replaced my 850 with a LinkComm RLC 3...not quite an 850
in some areas....better in others..programms TOTALLY different...
and the main reason I got the RLC3 is my link project which the
850 did not do (the original design of the CIB was to include a
4x4 crosspoint audio switch that WOULD have done it...but alas,
the plans changed and the crosspoint was dropped...)

My 850 is in mint condition, has the rear panel update, V.38 with
all manuals.....if you're interested, let chat in Email

73

The February 1996 edition of Ham Radio Online is available at
http://www.accessone.com/~vbook/hronline.htm

New articles are available now and we will be adding 1 to 2 new articles
each week.

Ham Radio Online has up-to-date news about Amateur Radio from around the world,
feature stories, real-time propagation and auroral condition reports, real-time
earthquake and severe weather conditions for emergency communications planning,
online humor section and the Ham Radio Online Library with fully indexed (find
any section with just a mouse click) Part 97 rules and regulations.

And we plan to offer some totally cool new services during the coming month. As
always its free and free of ads.

Thanks to you, we had over 10,000 readers stop by during January!

Please enjoy!

1754. R1 mod wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <4esc2b$qoh@coranto.ucs.mun.ca>
Source record: 206288

Wanted the 800 MHz mod for the Icom R1. Heard of the mod for the R7100
but not the R1.

E-mail 3020@infonet.st-johns.nf.ca

Thanks, Carl.

1755. Kenwood TM-241A / TH-22AT mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: jmleveron@socketis.net
Message-ID: <4estbp$n0@news.socketis.net>
Source record: 206289

Hi,

Does anyone have any mods for the current crop
of Kenwood TM-241A's or TH-22AT's? I believe that
Kenwood has redesigned the internals of the TM-241A
since a couple of years ago; the mod that worked on
the older radio doesn't seem to on the newer one.

Thanks for replies, here and/or by email!

73 de John.

>Any comments would be appreciated.

I bought a FT900 six months ago, to use in my new Chevy Beretta (tiny!) to help me pass the time on my 75 mile commute ... in short, I love it ... I'd recommend springing for the optional 500Hz CW filter, and the 2.1 SSB filter, but I see now that they offer a "Collins-like" mechanical SSB filter as standard equipment.

The receiver is excellent, the tuner works as well as any auto-tuner, but what I like most is that the ESSENTIAL controls are on the head, and that I don't need to program them into multi-function keys, and then try to remember what they do ...

The controls that remain on the main radio body are:

MOX, VOX, AGC-F, Mic Gain, RF PWR, Speed, Keyer (on/off), Break-in (on/off), and the direct freq entry keypad.

Everything else is on the control head, single function keys ... as a CW only op, I set it to QSK (vox off), and leave the speed set to around 20 wpm ... I adjust my sending my speed by spacing ... I could just shut the keyer off, and use a nice little keyer like the one in the Brass Racer, which would give me control over the keyer speed (but not necessary!).

It mounts nicely (get the optional swivel bracket) and can be easily and quickly concealed when parked (but try to hide that freekin' antenna! grin!)

1758. My K102D Is Pod-less, How to make some Pods?

It turns out that QST reviewed the Ten Tec Scout in the December, 1993 issue. I contacted ARRL HQ and they faxed me the review.

In the meantime, I've purchased the Scout, and had it on the air for the first time last night. An impressive little rig, to say the least.

A LOW COST PANADAPTOR
FOR THE R-7000

Copyright 1987 by Bob Parnass, AJ9S

[NOTE: This article was published in the July 1987 issue
of The Radio Enthusiast and the March 1988 RCMA
Newsletter.]

A panadaptor, or spectrum display, is a device which portrays visually the signals in a part of the radio spectrum. Panadaptors allow radio listeners to "see" activity on a portion of band without requiring the listener to tune the receiver.

They are useful for detecting the presence of spread spectrum signals or "hidden" signals riding on a subcarrier of a main channel. Panadaptors are invaluable for detecting spurious emissions from transmitters, and unwanted products caused when 2 or more signals mix.

Panadaptors most often employ a cathode ray tube (CRT) for the display, and must be connected to the intermediate frequency (IF) amplifier stage of a receiver, at a point before filtering takes place.

The ICOM R-7000 2-2000 MHz receiver rear panel has a phono jack for wide band 10.7 MHz IF output. A DC voltage is also present at this connector and is used to power an ICOM TV accessory.

I've seen mention of 3 panadaptors for the R7000:

1. John Biro's article on retuning a Yaesu YO901 Multiscope panadaptor for 10.7 MHz, restricted bandwidth use. Selectable bandwidths of 20, 100, or 200 KHz are available.

2. The Sherwood Communications SCA-7000 signal monitor, priced at $1600, and reviewed in May 1987 "Monitoring Times".1 Bandwidth adjustable from 1 KHz - 1 MHz.

3. The Spectra-Display, priced at $350, which requires use of an external scope.2 Bandwidth adjustable from 200 KHz - 10 MHz. Optional preamplifier required for 12 MHz wide sweep.

In the past month, several Kenwood SM-220 monitor scope/panadaptors have appeared at hamfests selling in the $200 to $250 range. The Kenwood SM-220 can display transmitted or received signals. To add spectral display capability to the SM-220, one must purchase the optional BS-5 or BS-8 module, which consist of a printed circuit board, a steel enclosure, interconnecting cables, and a new graticule. The panadaptor module mounts inside the SM-220 cabinet.

The BS-5 is used with the TS520 and TS530 transceivers, which have an IF of 3.395 MHz. The BS-8 is used with the TS820 and TS830 transceivers, which have an IF of 8.830 MHz. Since the IF of the ICOM R7000 is 10.7 MHz, one must alter the panadaptor circuitry to accept 10.7 MHz input.

If you have any choice in the matter, get the BS-8, as it requires fewer changes than the BS-5, and may even require no changes at all!

The panadaptor module circuit consists of several stages, but only two are directly related to the IF frequency:

1. A crystal oscillator is used as a marker generator.

2. A voltage tuned oscillator is swept across the IF of the receiver, and employs a varicap diode, an induc-tor and capacitors.

The marker generator is not vital for panadaptor operation. It merely provides a single "pip" that one may use to center the display on the CRT screen, and is similar in purpose to the crystal calibrator in older receivers.

The marker generator circuits in the BS-5 and BS-8 are identical except for one crystal. One need only replace the 3.395 MHz crystal (in the BS-5), or 8.830 MHz crystal (in the BS-8) with a 10.7 MHz crystal to adapt the SM-220 marker to 10.7 MHz IF. I did not alter this stage, although I would if I had a 10.7 MHz crystal handy.

The voltage tuned oscillator is the stage that deserves our attention. The changes required depend on whether you have the BS-5 or BS-8 panadaptor module.

Changes for BS-5 Module

Change the following capacitors:

1. C231 from 1000 pf to 68 pf.

2. C232 from .01 uf to 1000 pf. (You can use the capacitor which used to be C231.)

3. C234 from 100 pf to 22 pf.

4. C236 from 47 pf to 22 pf.

5. C237 from 680 pf to 100 pf. (You can use the capacitor which used to be C234.)

Solder a 10 microhenry inductor in parallel with L204, a 20 microhenry inductor.

Changes for BS-8 Module

I haven't tried the BS-8 module, but encourage you to try using it as is, without modification unless necessary.

These steps are needed only if you cannot find settings of the side mounted alignment controls that get the display to behave as specified in the owner's manual:

1. Remove C233, the 33 pf disc capacitor, from the printed circuit board.

2. Replace coil L204, the 4.7 microhenry inductor, with a 6 or 7 microhenry inductor.

Alignment

Follow the alignment procedure in the SM-220 owner's manual to adjust the panadaptor. This consists of adjusting 2 potentiometers and 1 trimmer capacitor through holes thoughtfully provided in the side of the cabinet.

The alignment instructions rely on the use of the internal Marker Generator to generate a signal at the center of the passband. If you haven't converted the Marker Generator circuit, you can tune your receiver to a frequency with a signal present at a known frequency (like 162.550 MHz - the National Weather Service), and use that as a frequency standard.

Most of the time spent in aligment will be in alternate adjustments between the trimmer capacitor and the wide band sweep potentiometer, which interact with each other.

Wider Bandwidth

The SCAN WIDTH switch on the stock SM-220 can be set to display a 40 KHz or a 200 KHz wide picture. I adjusted my modified SM-220 to display a 100 KHz or a 500 KHz wide picture. By adjusting the controls on the side of the SM-220, wider bandwidths are possible, but wider bandwidths make it more difficult to resolve individual signals close to each other in frequency. As the bandwidth gets wider, the hor-

izontal sweep loses linearity, causing the graticule calibration lines to be inaccurate.

Connection to R-7000

As mentioned earlier, a DC voltage is present at the R-7000 IF output connector and is used to power an ICOM TV accessory. A direct connection between the R-7000 IF output connector and SM-220 would damage at least one of these units.

To block the DC voltage, a 0.1 microfarad capacitor was soldered inside the R-7000, between the IF output jack and the adjacent jack labeled "spare". Connection between the R-7000 and SM-220 is then made using a short length of RG-58/U coaxial cable, with one end plugged into the R-7000 "spare" jack, and the other end plugged into the rear of the SM-220.

This leaves the original IF output jack undisturbed so it can be used with the TV adaptor accessory.

Vertical Sensitivity

When I connected my modified SM-220 to my R7000, the SM-220 would display only the strongest of signals. To improve the display sensitivity, I inserted a 20 dB gain RF amplifier between the R7000 and SM-220. The amplifier was a spare Ameco PLF2 FET receiver preamp, adjusted for 10.7 MHz, but other amplifiers can be used, provided they have at least a 500 KHz bandwidth, and sufficient gain, at 10.7 MHz.

False Readings - Images

The SM-220 circuit is like a superheterodyne receiver. The panadaptor itself has a 455 KHz IF, and like other superheterodyne receivers with a low IF frequency, is prone to images.

An image is manifested as a false pip, which moves across the screen as the receiver is tuned, and is 910 KHz (twice the IF) away from the actual signal.

The images discussed here are in the SM-220, not in the receiver. Images are bothersome on the strongest signals, like those 300 watt paging transmitters that saturate the county with RF, belching out out strange digital noises or voices (now illegal to monitor).

Use With Other Receivers

The modified SM-220 can be used with other receivers having a 10.7 MHz IF. In other receivers, one would need to find

the proper point in the IF stage (before filtering takes
place), install a connector, then wire a DC blocking capa-
citor between the IF stage and connector.

I have a Motorola Syntor X mobile radio built in 1986. I need to get a
copy of manual/schematics. Anyone have one? Wud be willing to pay cost
of copy/shipping.

Next; this is a UHF radio, but I know nothing about it. It is now used in the
402-430 mHz area. I want to know if it can be used in the Amatuer band.

Any help appreciated.

1763. REDUCING 6-METER SPURS FROM THE ICOM IC-735

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: flanders@znet.groupz.net
Message-ID: <4etfb1$8ee@news1.sunbelt.net>
Source record: 206297

NOTE: The below is being posted for Paul Bock, K4MSG, whose USENET connection is temporarily kaput. Please direct replies, queries, or attaboys to him at pbock@melpar.esys.com, which is still working.

REDUCING 6-METER SPURS FROM THE ICOM IC-735

Recently, I assembled a Ten-Tec 1208 6-meter Transverter Kit which my XYL had given me for Christmas, and which I planned to use with my Icom IC-735 HF rig to return to 6 meters after a hiatus of about 15 years. The "Blizzard of '96" having rendered outdoor work unpalatable, and roof work downright dangerous because of snow and ice accumulation, I decided to build a simple dipole and install it in the attic. This done, I proceeded to give 6 meters a try - but what a cacophony of in-band spurs greeted my ears!

With the 1208 connected to the dipole, which is located in the attic and about eight feet directly above the shack, tuning across the band from 50.0 to 50.250 (14.0 to 14.250 on the IC-735) revealed a vast array of spurs - some fixed frequency, and some of which "stepped" as the IC-735 was tuned - ranging in amplitude from right at the noise level (about S-2 on the IC-735 S-meter) to S-8. Several of the most prominent in the primary range of interest between 50.025 and 50.225 are listed below:

Frequency (MHz)	Amplitude	Description
50.047	S-7	Steady carrier
50.100	S-8	Steady carrier
50.121	S-6	Step (follows IC-735 tuning)
50.200	S-8	Mixed, steady & step
50.226	S-6	Step

Although I was able to successfully use the IC-735/1208 combo with the indoor dipole for 16 QSOs in 5 grids during the January VHF Sweepstakes, the presence of such a multiplicity of spurs, at least some of which were apparently emanating from the IC-735 (witness the "step" signals noted in the table above), was deemed unsatisfactory. I therefore proceeded to investigate the nature of the problem and to attempt to determine a solution.

The first thing I noticed was that removing the microphone from the HF rig eliminated many of the spurs and drastically lowered the amplitude of the stronger ones. Using a short length of wire as an "antenna," I alternately touched each pin in the chassis connector and discovered that although several pins were "hot" with the spurs, the worst offender was the PTT ground line. Touching a small bypass capacitor between the PTT ground pin and the chassis reduced the amplitude of the spurs several S units.

A word about where the spurs come from: Most are present inside the IC-735, at least some of them are synthesizer-related, and they are conducted between the PLL board and a small auxiliary board mounted behind the front panel adjacent to the mike connector. Signals are carried from this auxiliary board to the mike connector via a small, thin, plastic ribbon with parallel circuit traces on it; the end of this ribbon is soldered to the pins on the back of the mike connector (the ribbon has an eyelet pattern which matches the pin layout on the connector). Needless to say, any signal present on any trace is readily coupled to other traces, and with the microphone plugged in a ready-made "antenna" is available to radiate these spurious signals.

Despite the use of small RF chokes and some bypassing on the auxiliary board, the spurious signal levels audible in the 6-meter band when the antenna is located in the proximity of the IC-735 are quite prominent and annoying. Obviously, mounting the 6-meter antenna outside, high and in the clear and as far away from the IC-735 as practical, will reduce the spurious pickup. Some of the spurs were so strong, however, that I deemed it appropriate to try and reduce the amplitudes as much as possible; if reduced to the point of being a mild annoyance with the antenna only eight feet from the rig, I surmised, then using an outside antenna should render them inconsequential.

Unwilling to immediately make internal modifications, I reconnected the microphone and tried clamping a ferrite RFI choke onto the mike cable adjacent to the connector. The RFI choke consists if two 1" x 1/2" x 1/4" thick pieces of ferrite material, each with a longitudinal semicircular groove in it. Each piece is mounted in a hinged plastic cover and forms half of a clamp which, when placed over a cable and snapped shut, is supposed to reduce RFI leaving the equipment and traveling down the cable. It is intended to be used on personal computers to prevent radiation from keyboard and monitor cables.

The ferrite clamp proved to be something of a disappointment; while it did reduce the amplitude of the spurs, using one clamp only reduced the level about an S unit

and using two reduced the level no more than half an S-unit more. Given the amplitude of some of the spurs, I considered this to be inadequate, and so set about to determine what internal modifications could improve the situation.

I will spare the reader the details of all the measurements and combinations tried, but suffice it to say that internal bypassing is the only way to effectively reduce the spurs to a point where they become barely an annoyance; I was unable to eliminate them entirely. The remainder of this discussion deals with the final modifications as they were incorporated in my IC-735.

To accomplish the internal bypassing, first remove the top and bottom covers of the IC-735 and lay it on its top with the front panel facing to the left. This puts the mike connector on the observer's left and immediately in front. Behind the mike connector is a small, vertically-mounted circuit board, and pointing towards the observer from this board are several small, green RF chokes in approximate vertical alignment. These chokes are, from top to bottom: L8, L7, L6, L5, L4, and L3, and are in-line chokes for the PTT, squelch, UP/DOWN control, +8 vdc, audio output, and microphone "hot" lines, respectively. L2, the microphone return, is located on the same board but on the bottom left as viewed by the observer and is pretty inaccessible.

Since L7 (squelch), L5 (+8 vdc) and L4 (audio output) are not connected to any wires in the mike cable when the standard HM-12 hand mike is used, they can be ignored. This leaves L8 (PTT), L6 (UP/DOWN), and L3 (mike) which could be bypassed. During testing I determined that bypassing these chokes reduced the spur levels as follows (tests performed while monitoring the 50.100 spur):

L8 bypassed: Level reduced from S-7 to S-6
L6 bypassed: Level reduced from S-7 to S-4
L3 bypassed: Level reduced from S-7 to S-6

I also determined that bypassing L2 (mike return) would reduce the spur from S-7 to S-5, and bypassing pin 6 on the mike connector (PTT return, which does not pass through a choke) would reduce the level from S-7 to S-4. L-2 is located such that my soldering iron wouldn't reach it, but pin 6 of the mike connector was barely accessible from behind by *very carefully* reaching in. I therefore determined that I would install three bypass caps: One on pin 6 of the connector (PTT return), one on L8 (PTT), and one on L6 (UP/DOWN). Since bypassing L3 (mike) had only a minimal effect at best, it would be left alone.

The capacitors I chose were all CK05 square ceramic types, but disc ceramics should work just as well. The values I used were 0.1 ufd for bypassing pin 6 of the mike connector and 0.01 ufd for bypassing L8 and L6.

The RF chokes are easily bypassed, since they are mounted vertically to the board (horizontally to the observer) with the outer-most lead looped back down to the board. Make a small "hook" in one lead of a bypass capacitor (cut the lead length to about 1/4" or so), hook it over the wire of the loop, and tack it with the soldering iron; the other lead of the bypass capacitor should be grounded. Alternate loops have insulating sleeving on them, but as it happens the loops of L8 and L6 (top and third from the top as viewed by an observer with the rig upside down as described) have no sleeving and so the connections are easily made (see the note below regarding the ground connection point).

Connecting to pin 6 of the mike connector is a bit trickier: First, make a small loop in one lead of a capacitor (the lead can be cut to about 3/8" long first), bend the loop 90 degrees, then slip it over the pin. Reach in *VERY* carefully with a small soldering iron (25 watts or less) and "tack" the lead to the pin. ***USE EXTREME CARE NOT TO TOUCH THE PLASTIC RIBBON OR ANY OTHER INTERNAL COMPONENTS OR WIRES!!!***

The free lead of each bypass capacitor should go to chassis ground, and this is easily accomplished by mounting a solder lug under the nearest PC board holddown screw on the large board mounted to the underside of the IC-735. This brass screw is plainly visible on the left front edge of the board (as viewed by the observer with the radio facing left); just remove the screw, lockwasher and flatwasher, slip a lug over the screw shaft, and reinstall the screw with the lug facing toward the rear of the front panel. I used one of the long, tapered lugs. It's easiest if you install the lug *FIRST* before installing any of the bypass caps.

After installing the three bypass capacitors most of the spurs had been reduced to the point of being completely inaudible. Of the strongest of the original spurs, the two at 50.100 and 50.200 are barely audible at the noise level, the synthesizer-derived "step" spurs at 50.121 and 50.225 are no more than S-3 (with an S-2 noise level and the IC-735 preamp turned on), and only the 50.047 steady carrier is unchanged at S-7 (my guess is that this is an external signal; I have a couple on 2 meters from the local TV cable). There are no other spurs of any consequence within the range from 50.100 to 50.225 -oh, perhaps a very faint, almost inaudible remnant in two or three places - but nothing to interfere with weak signal operation. An outside yagi should

only make things better.

For those who may be wondering, I actually tried cutting the UP/DOWN line at L6 but it made almost no difference; bypassing is the only thing that really seems to work. Oh, yes, don't forget to ground the IC-735 to your station ground via the rear panel ground jack - the difference between "grounded" and "ungrounded" is about half an S unit (with no bypassing).

Incidentally, the modifications have had no adverse effect on operation of the IC-735, and in fact have made 6-meter operation very pleasurable. I can't wait for that first sporadic E band opening!

If you have questions or comments about the problem, tests, or procedures described, please feel free to drop me an e-mail at pbock@melpar.esys.com or call me at (703) 560-5000 x 2062 (weekdays) or (540) 882-4745 (evenings/weekends).

73,

Paul Bock, K4MSG

1765. DC connectors and wiring

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-02 00:00:00 UTC
From: gerryc@airmail.net
Message-ID: <gerryc-0202961123300001@dal20-19.ppp.iadfw.net>
Source record: 206299

ARRL Field Service, and Dallas RACES DC Connector Standards

The DC connector as recommended for Dallas RACES is the same as the one
that ARRL Field Service recommends, the 2 pin Molex connector with .093"
pins for DC.
The drawing for this connector configuration can be found in the ARRL hand book.
Having a standard connectors for DC and antennas and audio has proved it
"worth" time after time during tornado and weather situations.
During the emergency communications efforts after the Lancaster
tornado, lots of amateurs who were non RACES, volunteered there equipment
to help. Because of the variety of connectors much of it could not be used
during the first few hours of the effort. There simply was not time to
modify the equipment during the initial effort.

Amperage Rating

Some people will argue that ARRL field service people "blew it" and
this DC connector is not good for High Power (50 to 70 watts) 2 meter rigs
as the connector is rated at 8 Amps. Please note that Radio Shack was very
conservative with manufacturers ratings. This connector from Molex is
actually rated at 12 amps.
The connector was tested by my Employers Quality lab at 13.8 V at 10
amps. After 50 connect/disconnect cycles the drop across the connector was
50mv at 10 amps, and after 200 connect/disconnect cycles the drop across
the connector was 57mv at 10 amps. This connector will withstand a whole
lot abuse and still work considering the "intermittent duty" nature of
most mobile radios.

Parts and Part Numbers

This connector can be found by the Radio Shack part number 274-222.
This part number is a kit that contains 1 each male and female shell and 2
each male and female pins.
AMP and Molex make identical connectors that are directly
interchangeable and in fact carry the same part, under identical part
numbers. For those wishing to buy in bulk, the AMP/Molex part numbers are:

Male shell 03-09-2021
Female shell 03-09-1022
Male .093 Pin 02-09-2103
Female .093 Pin 02-09-1104

Each year after the National Weather Service "Skywarn" school we have a
"connectorizing party" to introduce new RACES members to the connector
standards and to help any who might be having trouble getting there radios
standardized. This is done for the price of the connectors or they can

provide there own.

Crimping or soldering

Our tests on this connector showed that most of the failures on this connector came not from the connector itself, but from improper field crimping. The failed connectors we tested failed because of crimps made with "any tool available" rather than the crimping tool recommended by AMP/Molex. The improper crimping caused arcing with the associated carbon contamination. Further tests showed that even improperly crimped connectors performed to spec. or better if soldered. For this reason in Mobile applications, CRIMP and SOLDER.
There is a NASA specification that calls for connectors to be "crimped when possible". It should be noted that this specification also covers the manufactures crimping recommendations and tooling.

Wire

Another failure mode that was noted was not from the connector but from the wire used with the connector. For Mobile applications 18 AWG (American Wire Gauge) is rated for 14 to 18 amps. Lamp or extension "zip" cord is rated in the 12 to 14 amp region.
18 AWG stranded wire is found in most any automotive parts store. Suppliers such as Radio Shack do not carry this size wire. Many of the failures came from people "one stop shopping" using smaller wire or solid wire that R'S. carried rather than purchase the larger "automotive" stranded wire.

Insulation and Strain Relief

After recommended crimping, you can add both extra insulation (to prevent fraying) and strain relieve at the same time with the addition of heat shrink tubing. Insulate both conductors with a 2 inch length of heat shrink per conductor. Make sure that the crimp part of the pin is covered with tubing. Shrink the tubing. After this is done, pass both insulated conductors through a slightly larger diameter of shrink tubing. A length of about 1.5 inches seems to work well, Place both of the conductors in the shell and seat the pins, slide the larger heat shrink down to connector shell, then shrink. Among other things this gives the connector a professional "finished" look.
The strain relief part from Molex works very well but is hard to come by in small quantity and is expensive. This compromise has worked well. Adding this insulation modification to an already assembled connector is possible with the "extraction" tool available from AMP, Molex and Radio Shack.

Using the larger "Heavy Duty" 20 amp connector from Radio Shack

Again for those who argue that the 8 amp connector is to small, Radio Shack also carries a larger, heavy duty connector similar to a Molex. (Female connector and Pins 274-154, Male connector and Pins 274-151). Besides the larger pins and current capacity, this connector has a very nice "positive locking" latch molded in the nylon. These larger connectors

seem to be in favor with the amateurs who like Mobile HF work.
Additionally, these connectors can accommodate a much larger wire size. 10 to 14 AWG. Again Radio Shack was very conservative with their ratings on this connector.
For those amateurs who use these connectors as their "standard" in the Dallas area, they also carry an adapter to convert this connector to the ARRL/Dallas RACES standard.

Existing Original Equipment Manafactures (OEM) Connectors

Many amateurs do not like to modify there equipment from the manufactures connector. They prefer to leave there equipment "original" as this aids in resell value. Again all that is required for the standardization scheme, is to have an adapter available to convert to the standard.
The OEM connectors do not have to be replaced, simply adapted to the standard.

1766. Re: QSK Cookoff

Source record: 206301

Hi:
Have recently developed a problem with my Kenwood TS-830s and
VFO-230. The VFO-230's digital display is now reading exactly 100kc
higher than that of the TS-830s.

TS-830s Display VFO-230 Display

3.757.0 857.0

Does anyone know of a short and simple correction for this
mismatch in displays. The VFO is controlling both the Receive
and Transmit Frequncies. The VFO even though displaying a 100kc
higher in freq is in fact operating on the correct frequency
which is 100kc below that of the VFO's display. Hope I havent
confused anyone, but anyone who can help would be greatly
appreciated. Thanks

From: "Gary P. Fiber" <gfiber@halcyon.com>
Message-ID: <4euqpj$9uu@news.halcyon.com>
Source record: 206107

Dave,

I do not have a modification but when you tune the 3220 above 449.995 Mhz or below 440 Mhz the Amateur front end is completely turned off. A two transistor front end is switched on and all of the receiving is done through that front end. This allows the radio to broad band. The sensitivity does go to about 1.5 microvolts though. Youwill need to find out how to enable the Amateur front end this will pick up the receive sensitivity, but the radio will be limited to the actual bandwidth of the amateur front end. May times one can stager tune the amateur front end to give a little band spread.

Yes the upgrade to version 4.0 is well worth it. The enhancements are a automatic setting of NIR when turned all the way to the
right, the peak mode is now adjustable, better noise reduction and better sound quality of the audio.
Prior versions sounded a bit to robotic at times. Hope that helps.

From: Dale Martin <kg5u@hal-pc>
Message-ID: <4f0fas$930@news.hal-pc.org>
Source record: 206111

A few years ago, at a Texas DX Society meeting, one of our members presented a program on connector loss at MF, HF, VHF, UHF frequencies, using the PL-259 series of connectors.

The results were pretty interesting and caused a number of us to change our minds about the 259 series of connectors.

His worst case scenario was to set up a string consisting of about 30 or 40 connectors (double female, double male, right-angle and straight). With a 50 ohm output signal generator, he ran through the spectrum and measured input power and output power (termination: 50-ohm non-inductive dummy load). The losses were negligible. Even at UHF frequencies.

I wish I could find the report on the program in one of our old newsletters, but I cannot. I will try to look for it through some of the other members or from Bill (k2tno) himself.

For what it's worth....

Steve,

Funny you should mention the FM-27B and the HR-2 in the same sentence. The running joke of that era was that if you had a Clegg FM-27B and a Regency HR-2 with a 146.940 receive crystal, you could indeed work all of 146 - 148 MHz at the same time! The Clegg was capable of transmitting over that entire range simultaneously and the Regency was so W-I-D-E that it could receive everything within 1 MHz of the crystal (Center) frequency!

"The way Clegg talks and the way Regency hears, it's a perfect match!"
Yenta the Matchmaker....

1788. Alinco DJ-580 - Size of DC plug?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-03 00:00:00 UTC
From: maultsby@vnet.net
Message-ID: <4eu8r4$pkc@ralph.vnet.net>
Source record: 206162

I was wondering if anyone out there knew what size plug was meant to go in the DC-in jack on the Alinco DJ-580. Alinco tech support in California swears they have no clue what it is, which I find hard to believe. The guy I talked to acted as if there was no reason that anybody would ever WANT to know something like that. I believe I have the 1.3mm plug, but it cuts out when the cable gets moved in the slightest little bit. I'm not sure if my plug is too big, or if something on the inside of the radio has been bent.

If anyone could tell me what size was meant to go in there, I'd appreciate it. I'd rather buy the plug at Radio Shack than spend 10 bucks on Alinco's version of it.

And I guess my next radio won't be an Alinco, if they don't even know even know the most basic things about their own radios...

>the resistors/caps is usually enough).

Admittedly, I've never evaluated one of these transmitter fingerprinting systems myself, but I have a little trouble believing some of the claims made about them. For example, the claim that each and every radio

is uniquely identifiable, even radios of the same model and production run. Granted, variation in component values will result in slightly different PLL characteristics, but I have yet to see any evidence that suggests that the resulting fingerprint varies enough to be considered "unique". Also, component ageing and temperature variation can cause considerable drift over time, and I haven't seen any evidence that this drift isn't great enough to change the "fingerprint" of the radio.

Another factor worth mentioning is that the characteristics of a PLL may change considerably as you change frequency, due to variation in gain of the VCO. A fingerprint taken at 144.0MHz may not "match" a fingerprint taken at 148.0MHz, for instance.

I'm also interested in how accurate the software algorithms are that are used to compare a captured fingerprint with stored fingerprints. I can't help but speculate these algorithms generate a likelihood of match measurement, and some arbritary level is used as a decision point (like, say 90% likelihood of match). Too loose a standard and many radios will match one fingerprint, too tight a standard and one radio won't match it's own fingerprint from one day to the next (or even one frequency to the next).

I've worked with people that built radar-signature analyzers (part of an electronic countermeasures system) and they indicated that the signature of a model of transmitter was very consistent from one unit to the next. Granted, radar transmitters are different than PLL controlled transmitters, primarily that a radar transmiter signature consists of both amplitude and frequency variation and a PLL transmitter signature is composed of frequency variation, but the fingerprinting technology depended on a high degree of consistency from one unit to the next.

Every time I bring this up, I get a handful of mail messages from people saying "we have it and we swear it works", and I think the concept is really neat and I'm sure there are some neat prototypes. I'm just not convinced the people using this technology are completely aware of how it works, and/or being completely honest about how well it works. I'm curious, and want to research it more sometime, and it would be neat if could discuss this technology objectively without immediately descending into an unrelated thread about repeaters, jammers, scumbags and the FCC.

Please note that I trimmed the Newsgroups: line, and have set the Followup-To: line to rec.radio.amateur.equipment.

1790. Re: yaesu ft-40 or ft-10 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-03 00:00:00 UTC
From: otterson@mindspring.com
Message-ID: <4eueeb$cqk@brickbat.mindspring.com>
Source record: 206164

Yaesu FT40R Expanded RF Modification.
420-480 Mhz, Transmit and Receive.

This radio is not type accepted for use outside of the amateur
70 cm band, and transmitting with it outside of the amateur band is a
violation of U.S. Federal Law.

1) Turn the radio off and remove the battery.

2) Peel off the black NiCd information seal, (under the battery) and
loosen (but do not completely remove) the 2 screws on either side
of the slot behind the keypad.

3) From the rear, carefully press on both screws to eject the keypad
slightly, then remove the screws to free the keypad.

4) From the front of the radio, carefully pull the keypad up and
toward the top of the radio.

5) Locate and unsolder the 0 ohm chip resistor at location "M"

6) Gently but firmly press the keypad back into place on the front of
the radio, taking care that the gasket seals evenly around the
keypad with no pinching.

7) Replace the 2 screws on the back of the radio. Do not over-tighten

the screws, they are screwing into plastic. Re-attach the NiCd
information seal.

8) Replace the battery.

9) Press and hold the knob and the light button, then press and hold
the power button until the radio turns on. You may or may not
need to reset the radio (knob, monitor & power) then activate
expanded RF (knob, light & power) to make the modification
effective.

10) Modification complete!

1792. Kenwood TR-8400 Info request

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-03 00:00:00 UTC
From: max@tvol.IT
Message-ID: <199602031033.KAA11857@alessia.tvol.it>
Source record: 206166

I'm looking for schematics, user manual and any oher info about the Kenwood TR8400 UHF transceiver.
I have a 2nd-hand one, and i'm trying to "resume" it: the -1600 repeater shift is not correct over 435Mhz frequency (-1625, very fun), it refuses to hold any frequency settings (including vfo freq.), so the battery is off, but i did not find the internal battery; the 1750Hz tone switch only puts on PTT but no modulation, and i'd like to adjust mike gain.
I'd like to solve those problems!
Thanks in advance for anyone helping me.

Radio Shack sells them. They are 10 channel UHF-FM with 2 watts out.
They are on sale for $179.95, regular price $219.99. RS stock number is
19-901RA.

You are correct. There is a power set pot.

It is located in the input area of the PA board.
This is the end furthest from the TR switch.
If the board was diviuded into thirds it would be in the center of
the third near the input.

It should be labeled R213.

Copper pipe can work fine, Ed. There are a few things to consider,
however. 3/4 inch copper pipe is equivalent to 2.36 inch wide copper
strap, but you can buy 5 inch wide strap for about the same price
as the pipe, and that would be better. Also, since this is for RF,
sharp bends (such as 90 degree elbow joints) must be avoided. That
increases inductance of the run unacceptably. And, the National
Electrical Code forbids depending on soldered joints in a ground
conductor. You must use positive mechanical clamping. You can solder
too, but soldering can't be the only joining method used.

Despite these gotchas, the water pipe will be better than a #10
wire.

In article n4lq@iglou.com (Steve Ellington) writes:
>
>Looking at the schematic, I see several relays. Of course there are the
>BP relays and the off/on relay but which one actually puts the rig in
>transmitt mode or are there more than one perhaps?

None of the relays put the rig in transmit mode. That's done by
the microprocessor. It asserts signals which switch a *bunch*
of diode switches throughout the radio, several of the circuits
are bidirectional, and on HF it switches a relay too.

That relay is on the filter unit and is called RL1. This toggles
the filter for the HF band selected between the HF PA output and
the HF receive preamp input. This relay doesn't *key* the radio,
but it does effectively switch the antenna from transmit to receive.
The antenna is connected to the other end of the selected filter
by the band select relays.

This relay is just to the right of J2, whose cable connects to
the PA unit output. This relay must be capable of switching
1.41 amps of RF current. It is driven active 8 ms before IC38
is switched to transmit to ensure that it is switched "cold".

Note that none of this applies on VHF. The VHF signal is wholly
diode switched, and VHF has separate filters and a separate preamp,
all on the PA board. Note also that there is also a RL1 on the PA
board, but this is a *band select* relay, not a TR relay. It selects
whether the driver feeds the PA for HF operation, or feeds the diode
antenna TR switch for 2 meter operation (when signal L8 is asserted,
but *not* when B8W is asserted, hint, hint, wink, nudge). Only the
driver is used for 2 meter transmission.

Another interesting little factoid. There are two separate receive
attenuators. The one for VHF is on the PA board with the VHF preamp.
The one for HF is on the main board with the HF preamp. The VHF and
HF signals don't join until they reach IC38, a diode switched
bidirectional 69 MHz IF amp, which is used for both transmit and
receive (and which, incidentally, is *not* switched into transmit
when the radio is tuning a VHF range outside the 2 meter band, hint,
hint, wink, nudge).

Harlan Falkin WB7OWF (harlan.falkin@prostar.com) asked:

> How do I find out about this publication? Does anyone have an
> address for them?

Amateur Radio Trader, published twice monthly by TAP Publishing Co.,
has a return address of:

P.O. Box 3729
Crossville, TN 38557

Advertising and subscriptions:

(800)774-2623
(800)423-9030 fax
(615)484-5137
(615)484-2532 fax

There's a subscription price of $2.95 on the front, but they sent me
a couple issues unsolicited (undoubtedly via FCC/Callbook records).

It's a cheaply done newsprint rag that's full of display ads. There
is no editorial content, they sell ad space, they charge for private
party classifieds, and they mail bulk rate, so if anybody actually
pays for a subscription the publisher must be doing pretty well.

Great test, Steve. And it backs up my experience on AMTOR and PACTOR,
the rig recovers *fast*. (And it should, the IF stages aren't powered
on and off for TR, their inputs and outputs are diode switched instead
because they're used bidirectionally and are always hot.)

>insertion loss.

I agree with Gary here. As I said earlier, I evaluated a group of sample UHF connectors on my HP-4191A. They were in the 25 ohm and higher range, so were all 2:1 or less.

But the bump they add is proportional to the electrical length and the amount of the mismatch. In a 259/239 junction it is a VERY short bump, less than an inch!

Virtually ALL of the discontinuity is in the SO-239 female.

It has NO noticable effect below VHF, and very little effect up to a few hundred MHz.

>Which impedance, the one presented by the ring and pin of the connector,
>or the one presented by the body of the connector, or the one presented
>between the inner and the hood on the back side of a SO239? They are all
>different. That's why the UHF series connectors are non-constant impedance.
>It's not just that they aren't 50 ohms, they aren't of course, but that
>they aren't any *one* impedance.

But externally they "appear" as one impedance that changes with frequency, and they can be perfectly compensated for over a fairly wide range of frequencies. The impedance only begins to "ripple" at UHF frequencies, causing perfect compensation to be restricted to narrow bands up there. As far as VHF or lower ***power losses*** go, you'll never see the difference between a single UHF and a type N !

At a recent Hamfest was able to pick up about 15 GE Master II low band radios and 5 Motorola Low Band units. We are first working to convert the Master II's first. Question we have is in regards to the temperature controlled crystal units (ICOMS). Does anyone have any experience in constructing the ICOMS or know of a source for the ICOMS so the units could be used on 6 Meters. Would appreciate any information!

>on Kenwood radios before. CAN YOU HELP????

This is probably RF getting picked up on the PK-232 cables and fed
back into the Ten-Tec's audio circuits. Try the usual stuff to get rid
of RF -- good grounds and ferrite on everthing.

I had the same thing happen on a FT757GX several years ago and this was
the cure.

>
>Kn2y

But now you have another problem, impedance transformation along the line.
If the ground line is an odd 1/4 wl long, it will be a very high impedance
at the rig!

What you need for RF is a lot of electrical mass at the ground point. When
I operated on the second floor, I lined the floor with foil (under the
carpet!) and used it for an RF ground. I tied the station ground to the
bare wire *safety ground* of the electrical outlet, and the heating ducts.
I still used an earth safety ground common to the power line entrance,
telco, and CATV grounds.

Gary, KE4ZV always has good grounding suggestions for safety.

Adjusting the Mic Gain on the 440 will NOT adjust the power like other rigs. I had a friend show me how to do it with a 9 volt battery. The theory behind this mod is to apply a NEGATIVE voltage to pin 6 of the 7 pin Din plug on the back of the 440. This is the ALC pin, which normally would get feed from a Linear and the greater the negative voltage, the more the power (amp. drive) is cut back. He used a 9 volt batter and a 1k pot. He connected the pot across the 9v battery and let the wiper feed pin 6. the + side of the battery went to the outer connector casing. I never used the mod, but it makes sense and should work. Good Luck and 73's

1828. List Server ACC Repeater Products

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-03 00:00:00 UTC
From: rrc2@engrng.pitt.edu
Message-ID: <rrc2.1.000CC32D@engrng.pitt.edu>
Source record: 206202

WELCOME:

ACC stands (stood!) for "Advanced Computer Controls". I think they started in the early '80s. The products they made included the ITC-32, RC-85, RC-850, and RC-96 repeater controllers; Shackmaster 100 (a vhf/uhf/hf remote base controller); Digital Voice Recorder accessory for the "RC" series of repeater controllers; FC-900 Remote Base Interface for ICOM band units; and FC-1 Remote Base Interface for BCD controlled radios. Also, they made some miscellaneous controller accessories such as an audio delay module and a multiple tone panel.
(Jim Gerke, KC5OA)

ACC stands for Advanced Computer Controls....started in 1982 or so by Ed Ingber WA6AXX...did the original "Talking Repeater Controller" in 73 Magazine during that time....

Made the following amateur products:

ITC 32 single board controller (Intelligent Touch-Tone Control board) for rptrs, remote bases, etc
RC-850 repeater controller - the original product from the
RC-85 a scaled down baby brother of the 850
RC-96 a revised version of the 85
SM100 (Shackmaster) a home station controller..allowed phone line/RF control of HF station and VHF/UHF rigs and BSR control of home equipment
DVR - a Digital Voice Recorder either stand alone or could integrate with the RC-xxx controllers above...1 to 3 channels operating independently or together.....(could be shared by three different rptrs at one site)

plus other minor products like Patchmaster 200 (a short lived commercial interconnect), Nspector software for the RC850 (using the computer interface--Version 3.5 and higher)

At one time had over 80% of the repeater controller market in the amateur service and a good amount in commercial service as well...Long time owner of the RC850 ending with V3.8 (the last release before the 850 was retired)....V 5.2 was the last software for the 85/96 series V 1.7 was last release for the SM100.

Rights to the ITC 32 were sold to Mike WB8CXO in the late 80s.......Hall Electronics (who sells the remote base interface) still offer it with a special software package to integrate to the Voter they sell.....(Chris WB5ITT)

Rights are now sold to Link Communications

On sideband you can lower the power by using the mic gain on the radio, and the carrier for CW, AM,FM,FSK.
If you want to internally set power lower then 100 watts on CW hit the VR pot,bottom of radio in the back.
You can set it at 50,60,80 or whereever if you wish.

On 02-Feb-96 19:06:08, John Maultsby articulated:

>I was wondering if anyone out there knew what size plug was meant to go in
>the DC-in jack on the Alinco DJ-580. Alinco tech support in California
>swears they have no clue what it is, which I find hard to believe. The guy I

As I do as well.. Perhaps your question wasn't clear, they've always been extremely informative for me.

>talked to acted as if there was no reason that anybody would ever WANT to
>know something like that. I believe I have the 1.3mm plug, but it cuts out
>when the cable gets moved in the slightest little bit. I'm not sure if my
>plug is too big, or if something on the inside of the radio has been bent.

1.3mm ID, 3.4 OD, length I'm unsure about.. I have two such plugs that I use from other things as they are fairly hard to find, and both work fine. I am quite careful with them, however, I have broken the centre pin of my DC jack before..

>If anyone could tell me what size was meant to go in there, I'd appreciate
>it. I'd rather buy the plug at Radio Shack than spend 10 bucks on Alinco's
>version of it.

Rat Shack calls this a Sony plug.. However, it's crap.. :) It's intended for their AC-DC power adaptors, which have two terminals coming off the bottom intended for plugging into their cord, rather than a normal arangement for soldering wires onto. Check other electronics stores perhaps.. Mouser electronics also carries this plug, however unless you're going to be buying other stuff their minimum order charge would be more than the plug itself.

>And I guess my next radio won't be an Alinco, if they don't even know even
>know the most basic things about their own radios...

I guess the janitor must have picked up the phone, because they have always been extremely helpful when I've called. I just wish they had a definate answer about what #120 and #127 do. :)

1839. Revised Pages for Feb

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-04 00:00:00 UTC
From: asperges@innotts.co.uk
Message-ID: <31153178.6859498@news.innotts.co.uk>
Source record: 206063

I have revised and revamped:

http://www.innotts.co.uk/~asperges/

to include packet radio amongst other things. The pages have useful links and an enlarged Q and A page. There are useful links and a new IRC link to #HamRadio. Try the other pages too.

Thanks to all who have visited so far. I have replied to all e-mail received. It has been very encouraging,

Check it out!

The common name for these radios is "cellular phones". The silver one is part of the Motorola "bagphone", the other is part of a car kit. Since providers will give you a cellular phone for signing up, you'd spend more for replacement handsets for these radios than they are worth. Salvage them for parts.

Rec.radio.swap is the group for buying, selling, and trading of
radio equipment. This group is for *discussion* of amateur
equipment. It's in the charter and the FAQ. Unfortunately,
few people seem to bother to read those anymore.

Web browser access to the newsgroups is an abomination. Death
of usenet imminent, film at 11.

>ground loops.

The biggest concern is kiloamperes of lightning induced RF, and the
impedance differential between equipment "ground" terminations then
becomes *critical*. Ground loops are always *current* loops. Expressed
voltages are only a function of those currents expressed across an
impedance.

Why not, Floyd? Output power is a function of modulation level for
a SSB transmitter. If it weren't, the radio would put out as much
power when you weren't talking as when you do.

These units are Motorola Cellular transceivers. The value would be about
$25.00 each since you do not have the handsets. Even if you find a handset
(which is extremely specific to each model number) they likely will display
"LOANER" since the esn's will not match.

1856. ACC Shackmaster SM-100 HF/VHF/etc Controller

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-04 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9602042232.AA29568@shelob>
Source record: 206080

I have an ACC shackmaster SM-100 in mint condition,
with the latest Version Software before ACC(Advanced
Computer Controls.
Did ACC sell the rights to contoller to anyone, it is
a great HF to link controller interface which I used for
my Icom 751.
Now I have the Icom 706, and it would be great if the
Shackmaster 100 could contol this. Anyone out there know
if this is possible!!
If someone has taken over the Shackmaster SM-100 from ACC,
I would be happy to find out if I can get the SM-100 to control
it.
Anyone know of any telephone line to controller interface that
would remote contol the IC-706 would be appreciated. Would like
to use it via the SCOM 7K autopatch repeater controller.

>Interested in user comments on this rig.

It seems to perform well for me, and the features are right. My only complaint is that the optional speech board (for frequency read-back) is not an option for the 2350H. (It was on the 2340H). This feature is very handy when remotely controlling the rig via DTMF tomes. I can't imagine that very much was saved in the cost by its elimination, since it was an option board anyway. Also, their full page ads in QST and other places list this option incorrectly as being available.

1862. R390A DELUXE SHORTWAVE RECEIVER $300

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-04 00:00:00 UTC
From: flanders@znet.groupz.net

Source record: 206124
Cross-posted to: rec.radio.amateur.equipment,ga.for.sale,us.sc.columbia.forsale,rec.radio.shortwave

Excellent short wave receiver for SWL or Ham radio.

Many think this R-390A/URR is the best SWL receiver ever made. This one is a late model (one of the last production runs), made by EAC. It is big, heavy, uses tubes. Quality look, feel, and performance. 110 or 220 VAC. Even has ovens for oscillator stability.

Has 6 IF selectivity filters (0.1, 1, 2, 4, 8 and 16 KHz).

Also 2 audio filter positions (Wide and Narrow).

2 meters (Line Level, Carrier Level).

Total of 17 knobs (Line Meter sw, Line Gain ctl, Ant Trim ctl, AGC sw, Limiter ctl, Audio Response sw, Break-In sw, Bandwidth sw, BFO Pitch ctl, Function sw, BFO sw, Dial Lock ctl, Zero Adj ctl, Local Gain ctl, RF Gain ctl, Megacycle Change ctl, Kilocycle Change ctl)

Rack mount style (no cabinet, but has all covers). 19 in wide, 10.5 high, about 15 deep.

No speaker. No manual (Fair radio sales has manual).

It is unusually clean, near-new appearance. I can furnish photos with SASE - ask.

$300 plus UPS if shipped.

Then please explain why it has one. I am refering to the internal lithium
battery, labled BT1001 on the schematic that came with the radio, Yaesu
P/N Q9000637. I can't figure out what they are doing with it. But
Yaesu's note, that it doesn't need to be replaced "for several years"
(FT-51R Technical Supplement pg.2-3) is NOT very comforting.

Both radios measure 8 3/8" x 3 1/2" x 2". One radio is marked with the model #S2046B. It is silver in color (aluminum), has a "parallel port" type connector and an antenna connector on one end. It has one circuit board inside the case.

The second is black in color and has the same connectors on one end and what appears to be a large "telephone jack" on one side near the front (mike connection?). It has two circuit boards on the inside. It has the model #F19ZEA8442BG.

I have the cables but I do not have the control heads. Are they available?

What is the common name for these radios? Frequency ranges? Number of channels? Value? Etc.?

Thanks for an help you can give!

1867. TM733A Mod Discrepency? Anyone do it?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-04 00:00:00 UTC
From: gcortevi@ix.netcom.com
Message-ID: <4f3027$bkc@cloner2.ix.netcom.com>
Source record: 206129

I was about to do the extended RF mod for my Kenwood TM-733A when I noticed a couple discrepencies and had some second thoughts. Following my message text is the relevant portion of the mod file I found on the Jan 1996 QRZ CD-Rom.

According to the mod, the resistor that needs to be pulled is just to the right of a chip labelled XRU-4066BF. In my radio, the chip is labelled BU-4066BCF. Just below that number is another: 405 110. The numbers are similar and I don't see any other place on the radio even remotely close to the one described in the mod. But before I go an ruin a $600 radio, I thought I'd ask if anybody has done this mod and what their experience with it was. Perhaps the radio's design was changed since the file was written?

Also, what is the best way to remove B0? Solder secures is on both sides. However desoldering it has the potential of melting the board. Yanking it out with pliers has the potential of pulling traces out of the board. Any suggestions?

My main interest is in the UHF extended receive. It picks up a good chunk of the military aircraft band. That's something my scanner doesn't do.

Here's the relevant portion of the mod file:

---snip---snip---snip---
Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
Release 2.1 Updated March 1, 1995

Extended RF Modifications

Refer to diagram below. (Inserted into Release 2.0)

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically mounted just behind the front panel wall (which can be removed easily

if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear)
are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for
surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio.
It will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.
If the mod is done correctly, it'll play a little song for you. (r2.1)

ONLY Removing Jumper 1 (B2) is the MARS/CAP modification.

** Diagram of specified area on Control Board **

EDGE OF BOARD, viewed from the rear, looking toward front panel

Green jumper wires (B2, B3)

The jumpers are actually soldered on the other side of the board,
but the loops come up over the top and hang over the B0/B1 side.

B0=R414
B1=R412

Here's something interesting! According the Kenwood rep I spoke to,
performing this mod *does not* void your factory warranty. The same
goes for any Kenwood published service bulletin or modification info.
We are encouraged to perform the repairs ourselves to save them the

trouble and expence.

ICOMS (A GE term Intergrated Crystal Oscillator Module) and Channel
Elements are available from a number of sources.
Check with Wolf Communications in Billings, Montana.

International Crystal will sell you a channel element on your desired
channel.

Message-ID: <4f1l8k$a0m@newsbf02.news.aol.com>
Source record: 206133

Hello,
I am going to be running a DX/CLUSTER Node... and currently I have 1 VHF 2M radio and a dual band mobile 2M/70cm. Well, the problem I have is I don't want to use the dual band for the node cause it will take over one end of the band and so, the other band will just be a waist cause I can't transmitt on 2 bands at once.. So, I am needing a CHEAP... I MEAN CHEAP 440 radio could be 1 channel programmable or CRSYTAL I don't care...the only care I have is I need it programmed for 430.0500 MHz or crsytalized at 430.0500 and at least 10watts.

Anyone have a 440 radio that can will go to 430.0500?? Also, need the wiring diagram for the mic so that I can wire my TNC to it!

Looking into spending only about $100 - 150

Let me know if you have anything.... Thanks N9MXT1 - Jeffrey

Yup, both QST and CQ did reviews, I will look for them and let you know. BUY a Scout..you will be glad you did. Wonderful image-free, clear receiver (sounds as good as a Lowe 225 swl receiver, which beats IC71A and R5000). Modules easy to change. Get the optional Noise Blanker (it really works!). Keying is crisp and clear, the QSK of TenTec is legendary of course. Not much better a rig, for about $700 with Blanker, Microphone. Plenty of audio from good internal speaker. I use it backpacking and mobile and it is rugged and tough. It fell out of my pack onto rocks and merely dented the case, fired right up. See if you can find a ham in your club who has one, play with it, listen to that amazing receiver. 50watts output does as well as 100watts, as you know. I like mine so much, I am gonna get another one. I've had it 2and a half years now, bought it at Dayton and will get another there this May. Enjoy it! Cant beat it for the money, and it beats my FT900 in many ways. 73 de N1FSK

1874. SWAP Rockman Mini-Amp for Hickok 752 or TV-2 Tube Tester - rock.tub [1/1]

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-04 00:00:00 UTC

Message-ID: <4f10lc$hf3@csu-b.csuohio.edu>
Source record: 206136

Swap Tom Scholz Rockman mini-earphone amp for Hickok 752 tube tester. Will also consider military TV-2 like the Canadian military TV-2 that one can dial-in all the tube's specs.

Rockman has the following features. Has five controls, two inputs (aux. stereo & mono) and two earphone outputs for you and a friend or to hi-fi system.

Control #1 = Normal, echo off, chorus off
Control #2 = Distortion, Edge, Clean 1, Clean 2
Control #3 = Volume, Max, -5 db, -10 db
Control #4 = Gain, max to min.
Control #5 = On, Off with pilot light

The unit really sounds great and you kinda feel like you are on stage with your amp cranked, but you don't aggravate loved ones in the house or neighbors who do not appreciate what a fine instrumentalist you truly are. The unit is in its original box. It uses 8 AA batteries.

If interested in swapping kindly email me. Thanks.

From: PDelpriore@gnn.com
Message-ID: <4f2ikb$vo@news-e2a.gnn.com>
Source record: 206140

When I use my computer, if someone else is watching TV using off air antenna annoying interference is present on TV, mostly channels 2,4,5.
I don't believe due to ac line path since no interference when watching tape from VCR or if watching TV from satellite Dish, whose signal is in the gigahertz range. In addition a portable TV running from my car battery in the garage also shows the same interference. Downlead from off air antenna is coax with antenna on roof three floors up so interference not picked up by downlead.

Many thanks for any help with this problem.

That's very true if the equipment is spread out all over the room or if there are low level video and audio lines involved. But it's a lot less worry with Ham type RF equipment grounds than critical audio and video BC systems where millivolts of AC hum (from ac power main loops) cause big headaches.

Most Ham gear is close together and generally the only low level lead susceptable is the microphone lead. It isn't grounded anyway except at the rig. For Ham use, a wide buss along a desk or wall can be used and doesn't hurt a thing. It all depends on how much impedance you have between the points on the buss, and what the type of equipment is.

Most of the worries are in volts of RF, not millivolts of power line ground loops.

I too can attest to the helpfulness of the TX-ID system. Coupled with our
Doppler Systems DF gear, the TX-ID has allowed us to bag several Drew-like
scumbags here in the RI area who have no appreciation for Part 97.

Track tuning is not an unalloyed blessing. Strong signals can shift
the bias points of the tuning varactors, effectively AM modulating
your signal passband, not a Good Thing (tm). Hard switched bandpass
filters are a bit better, though they don't help against strong
in-band signals. Best is to make the first RF amplifier and the
first mixer stout enough to resist intermodulation. That generally
requires high standing currents and a high level LO, both of which
eat batteries at a great rate, which is why HTs rarely take this
course. Works good in mobile and base rigs where limited power
isn't a concern, however.

What you want is called a simpatch. Connect Systems makes one. Be careful, however, to check your rules about using this. In the US, its use is auxillary operation and must be done above 222 MHz. It can't be used under automatic control here, so you have to be in control of it at all times. That means it can't send you telemetry about incoming calls unless you command it to do so, and remain at a control point while it does/can, IE you have to disable telemetry any time you leave a control point. Since that's just good practice anyway, it's not a disabling limitation.

You might try Communications Electronics Inc at 1-800-USA-SCAN
They carry some Maxon and Uniden radios for GMRS.

Another choice is to hook up with a Motorola dealer and inquire
about their "Radius" line of 2-way gear. Generally, you need to know
a bit more about what you need when talking to a 2-way dealer.

Another source of information is the Personal Radio Steering Group. A reader
said they have lots of good information and are enthusiastic about GMRS.

Hi Gary,

We had this discussion a while back here in one of the amateur newsgroups. The MIC Carrier works only in the AM, FM and CW modes. In SSB it does nothing. The MIC Gain control will reduce the transmitted audio level to the point that you cannot be heard, but it does not reduce the power out. Power will reduce, because there is little or no audio transmitted. The guy that gave me the mod I listed used it to work QRP. He said that someone at Kenwood told him that it was the only way to reduce the level. The TS-450, which replaced the TS-440, has a PWR Control that does reduce the power out. I guess Kenwood realized that they forgot to allow an operator to do what the FCC requires, use the least amount of power to make your communication path reliable. Although I have not made the mod he told me about, it looks like it should work, since the radio will respond to the ALC feedback it receives from an amp. I hope that helps explain it a bit.

At a flea market I picked up a Satellite Controlled Clock model1026B made by Arbiter Sysytems Inc. I'm looking for any general info on this unit as I'd like to fire it up if practical. The front end appears to be tuned for the 470 MHz range so I'm wondering if it really uses a satellite in this range or if it uses a down converter at the antennna. Any info would be greatly appreciated.

>POWER OUT, but it has exactly the same effect. You can think of the

Technically true. However, in practical situations using the MIC gain control to control power is troublesome. So maybe this is a different problem. I know that on my 440 it is next to impossible to get it down to a reliable 5 watts PEP output using the MIC gain, since any movement in the area of the mike itself will change the PEP output substantially. There is no setting where I can just sit back and ragchew - counting on about 5 watts PEP output. It will vary from 2 watts to 25 watts or more. Now, by using the audio processor I can get it a little closer, since the audio level is held more steady. By using ALC control, I get much closer to what I want...which is the way other transceivers do it? Does anyone know? Is the audio circuit in the 440 just unstable because the MIC gain is not a reliable, steady power control?

>Power will reduce, because there is little or no audio transmitted.

Which is it, Floyd? In one sentence you say power won't be reduced,
in the next you say it will. The audio level controls output power
completely in SSB mode. The mike gain pot may not be *labeled*
POWER OUT, but it has exactly the same effect. You can think of the
SSB modulator as simply hetrodyning the voice signal up to some RF
frequency. Any change in voice level affects a corresponding change
in RF level.

The ALC turns down the gain of a *linear* RF amplifier while the
mike gain effectively turns down the gain of a *linear* audio
amplifier. Since both are linear, it doesn't matter which you
turn down, the effect is the same, less transmitted power.

The only possible time this wouldn't be true would be if you
were *overdriving* the audio and making it non-linear, then
power output wouldn't change linearly with audio level, but
we wouldn't want to do that would we? (Sometimes we do, and
it's called speech compression, but lets leave that out here
since we *really* don't want compression on RTTY tones because
the distortion would make them difficult to decode.)

Kenwood may have made a mistake here in leaving a pot labeled
POWER OUT off the radio, but the mistake wasn't a technical
one. It was the mistake of assuming amateurs would know that
turning the audio level down in SSB mode accomplishes the same
thing.

There is a technical reason for controlling power at the final
RF stage, but it is of no interest here. That is to reduce
levels of transmitted amplifier noise and carrier leakage in

proportion to the desired transmitted signal. With well designed equipment, and reasonable power turn down ratios, this can be ignored. You'd have to reduce power a *lot* (down in the milliwatts) to approach an area of concern about residual noise transmission.

If you would have sent your radio in to Yaesu the first time for
repair, it would have been fixed right at minimal cost. Since you may
have soldered (in your attempt to repaire) the board several times it is
probably messed up beyond repair.

I have had repairs done at reasonable cost at yaesu and never had any
problems.

Good Luck......

My 733 was considerably worse in intermod rejection than my Icom 2410 was, back when I lived close to a cluster of 2-way system towers. A little farther out in the suburbs, though, and it's no problem. I agree with the suggestion of borrowing one and testing it at your location before committing the money.

Message-ID: <96036.140031U40241@uicvm.uic.edu>
Source record: 206020

From O.M. Radio Company, Jan. 31, 1996:
"As I am sure you may be aware, Atlas Radio Co. has experienced many set-backs and delays in its attempt to develop and produce the Atlas 400x radio. Herb Johnson, the founder of Atlas Radio, has produced many thousands of radios in the past and is a distinguished and highly respected Ham Radio innovator. Herb has been left drained and exhausted by the experience and is deeply sad-dened by the disappointment of his loyal Hams around the world.
I, too, was disappointed having loaned Atlas...tens of thousands of dollars. O.M. Radio, with which I am affiliated, had been considering the purchase of Atlas Radio for several months. After closely reviewing the books of Atlas..., O.M. Radio has decided it is not able to complete this transaction. I do not blame Herb Johnson for the failure of Atlas Radio Company and I hold no ill will. Herb honestly tried his best.
However, I am well aware that you have placed an order (157) for the Atlas 400X and have a deposit with Atlas Radio Company. I also know that you are expecting a radio. During the past year, O.M. Radio has had several radio projects underway, and is near completion of design on a new HF radio that will soon be available. Even though O.M. Radio has no obligation to do so, out of respect for Herb Johnsonand all of the hams waiting patiently, we would like to consider offering you a radio and honoring your deposit made for the Atlas 400X radio. (In some cases, we are aware that full payment for the Atlas 400X radio has been made.)
Specifications for the new O.M. radio will be available soon. We are all very saddened about what has happened to Atlas Radio Company. O.M. Radio will keep you informed of our progress and the schedule with the HF radios. 'Please note: O.M. Radio is not currently accepting orders.... until we are ready to ship the radio and we begin our advertising programs.'
Regards and '73,
Ken Hudson "

The more metal you get involved the better. Try airconditioning ducts, water pipes and gutters. Chain link fence is a paticularly =
good thing to tie ground to if there is a some around. To cut down on resonance problems you would like to get lots of different le=
ngths involved so you do not wind up with the 1/2 wave high impedance condition.

Keep a long roll of wire around and if you do work like sprinklers, sewers, water pipe with the ground open throw wire in the bottom=
of the trench and tie it to ground.

If there is a swimming pool available get tied into its drain system (and thus into the swimming pool). The clorinated water is alm=
ost as good as sea water.

Good Luck

1915. Info Wanted: NIR-10 vs. NIR-12 DSP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-05 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4f5h1n$kil@pacific.mps.ohio-state.edu>
Source record: 206027

I've heard that the NIR DSP filters are the best around, but would like a wider sampling of opinion on the subject. What are the differences between the NIR-10 and NIR-12? I don't need lots of bells and whistles, don't care about narrow filters, but want really good noise reduction and carrier notch capability. Also would like to have an AGC circuit so I didn't have to fiddle with the volume level out of the receiver. An uncluttered front panel would also be nice. My present DSP is the original W9GR filter, built from QST article. It works well but isn't user friendly, and the 8 bit A/D conversion gives lower level rumble and makes my rx sound like the speaker was at the bottom of a deep well.

Seems I've read on one of the newsgroups a while back of modifying a cell phone into a transceiver. I picked up a couple of Motorola cell phones for next to nothing at a "junk" store the other day thinking they were transceivers (the handset was missing so I didn't know exactly what they were <g>).

Anyone know if this is possible? And how do you go about it?

Thanks for any help you can give me!

Depending on how much money your sponsor is willing to pony up, I'd get an IFR1500 with tracking generator if the bank is flush. Otherwise, an IFR1200S is the cat's meow. If you can live without the spectrum analyzer, the IFR500A is a goody too, and easily tower portable (that's what I use to service my repeater, located 970 feet up a TV tower). The only IFR I'd avoid is the IFR1000 (what a boat anchor, though you might find one *real* cheap). The Motorola 2001 is good too, but a heavy thing to tote to a remote site. It's something you'd prefer to let hold down your bench.

Lesser instruments by HP and Cushman could be pressed into service in a pinch, but don't even think of the Ramsey service monitor, a total waste of money.

Expect to pay between $9,000 and $18,000 for a top flight service monitor, though you can do much better on the used market. You can find an IFR1200 for around $4,000 if you look hard, and a complete recalibration and certification from IFR is only $250. (And well worth it too, don't let Joe's Discount Service Monitor Calibration and Donut Shop touch your IFR.)

IFRs are very rugged too. Cushman has one almost as rugged, but somewhat feature poor. The Motorola has lots of bells and whistles, but is rather delicate for all its bulk, and the HP needs to be placed on a feather pillow. You're going to bounce this thing around in a Jeep up forest service roads, drag it off a precarious perch on an equipment cabinet, etc, and you want it to keep working and stay in calibration. The IFRs can do that, the others.....

Message-ID: <4f5eec$esp@superb.csc.ti.com>
Source record: 206086

I guess I should clarify my comment about the 8500/5200 separation kits. The 8500 kit (about $90) includes the display/control (D/C) cable, a mounting plate that the display snaps into, and extension cable for the mic & ext. speaker. The 5200 kit (about $45) comes with the same D/C cable, a DIFFERENT mounting plate (8500 display doesn't fit), and an extension cable for an ext. speaker. The D/C cable can either be secureed to the mounting plate (making display removal easy) or to the back of the display.

For my setup (8500 under the seat), I used the 5200 D/C cable with the display in a 'fixed' location (velcroed in the change tray). I used a regular phone extension cable (modular plugs) and a 'gender-bender' as a mic extension cable to the armrest 'box'.

I have had no problems worth mentioning with intermod on the TM-733A.
Compared to my TH-78A hand-held radio, the 733A is great!
I have noticed that the RF environment is critical to which radios work
well and which ones don't. The 78A was nearly useless in parts of the
Rapid City, SD area last year. There are problem spots around the
Los Angeles area too. By comparison, my friend's Yaesu FT-530 had
intermod troubles too, but in different geographic environments.

In short: borrow a TM-733A and use it in the place you will need it,
before you commit the cash for a new one.

BTW: one of my old timer friends says the problem most people have is
cross-modulation, or mixing, and not intermod. Intermod is something
that happens in transmitters, not receivers. Eh?

Hope this is a help to you.

Good info. The first service monitor I got to play with in college was an IFR-1000S. They kept it in it's very own locked cabinet, in a locked room thru another locked room. A constantly revised list of what students were or weren't permitted to use it was maintained by one of the teachers. And even with that using it was a matter of carefull review every time you wanted it. If the faculty guy responsible for granting permission had to leave the building, the IFR-1000S went back in its cabinet, in its room thru another room. You had to become very familiar with the fellow's schedule to schedule the most time with the IFR! They really really really liked (and could not afford to replace) that instrument.

Thanks much,
Chris, N7RME

>Anyone have any ideas? Please e-mail at: agia@ix.netcom.com
>
>Anthony Giammarino - WA6HTF

I had the same problem. I sent the radio to Kenwood for warranty
repair. The problem was apparently a bad transistor, not just in my
radio, but in many of their 241A's. I had a similar problem with my
microphone -- a problem that was inherent with all 241A microphones.

It seems as if Kenwood knows that there are problems with their 241 line,
but will not recall any of them. They just hope that the owners will not
eventually stumble upon them. Then when you call them, they play
stupid. That's what bugged methe most! My $0.01 ($0.02 after taxes).

Source record: 206098

Von: scam
An: Koellner, Guenter
Betreff: Cell mod instructions and diagram.
Datum: Montag, 11. Dezember 1995 14:47

--========================_7315378==_
Content-Type: text/plain; charset="us-ascii"

Guenter,
Here's a copy of the cell mod diagram, in GIF format, and the
instructions
I wrote up.

Instructions for the C568A cell restore modification:

1. Disconnect the battery and antenna.

2. Remove the two upper black screws from the back of the C568A case.
(The
black screws with arrows pointing to them.)

3. Remove the two small screws connecting the battery slide plate to the
front cover.

4. Carefully pull the front cover up and away from the back of the
radio,
being careful not to damage the ribbon cables.

5. Remove the two black and two silver screws holding the top circut
board
to front of the C568A case, noting their locations.

6. Carefully pull the top circut board up and away from the front of the
rig, exposing the LCD driver control board. (P206)

7. Position the radio to allow access to the LCD driver control board,
being careful not to damage the ribbon cables connecting the various
circut
boards.

8. Once you've accessed the LCD driver control board, locate Q101. Next
to
Q101, locate Q113, directly to the right of Q101, which is notated on the
circut board. Locate the horizontal surface mount resistor (R124), which
is
to the right of Q113.

9. Directly below the left side of R124, is R117, a small surface mount resistor, which is in a row of empty pads. With a low power, small tip soldering iron, remove R117, being sure to use great care not to apply too
much pressure or heat to the circut board. Normal SMC techniques and grounding precautions should be used.

10. Reassemble the radio, making sure that the screws are in the correct locations and being careful not to pinch or damage any of the ribbon cables
in the process.

After reassembly, an "All Reset" must be performed, as per instructions in
the users manual. All memory contents will be erased.

The C568A will now receive the previously blocked portion of the 800mhz band. (869-896mhz)

One of may responses

I think this is designed for use with the Swan (Cubic) 103 or MX 100
mobile HF rig. It is designed to be mounted at or near the base of
a mobile HF antenna. It's purpose is to add additional capacitance
to the base of the antenna to allow improved VSWR matching. I believe
these particular units were pop-rivetted shut...making service difficult
unless you "drilled" the pop rivetts.

MFJ, I think, makes a similar unit with similar purpose.

>chunk of the military aircraft band. That's something my scanner
>doesn't do.

I went ahead and bit the bullet, so to speak. The chip number didn't match on mine, either (can't remember #; TM is in car; bear to get out) but everything else was in the correct position. I performed MARS/CAP first, as it would be easy to repair. Worked as expected after cut, so I desoldered the ends (so no loose connections, etc.)

Then I (most carefully and with great anxiety) desoldered one end of the "resistor". It was indeed tiny and was marked w/ a small gray "V" looking symbol. Put tone board in, and fired it up. Without even resetting it, it played the tune. Works fine, but intermod is present anywhere near our local paging tower (suspect it would be there w/o even doing the mod, tho).

Just my .02 worth; standard disclaimers and cautions apply.

John.

Hi Gary,
In article <1996Feb4.165635.16444@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:

>The biggest concern is kiloamperes of lightning induced RF, and the
>impedance differential between equipment "ground" terminations then
>becomes *critical*. Ground loops are always *current* loops. Expressed
>voltages are only a function of those currents expressed across an
>impedance.
>
>Gary

That's true, and like so many things everything is more complicated than it seems.

Let's see if we agree on this. I'll try to make it short.

The best place to keep the lightning is *outside* the house. We need to avoid ground loops *through* the station from power line or antenna system hits or near hits. That is best dealt with by bringing all the cables in the building at one point. the cables are all connected at that point to all the grounds entering the building. Everything inside the building is tied to a common point at the enterance.

As a side advantage, conducted current RF loops are also eliminated.

The operating area goal is to have everything move in unison.

The use of either a desk type ground buss or a star type arrangement is fine and mostly a matter of convience so long as power leads, grounds, and the antenna leads enter and leave the operating area (let's call that the "desk") correctly. The correct way to bring ALL the leads in is to tie them to the safety ground at the point where ALL the cables and wires enter the desk area. That would insure one common ground point for everything that can be safely grounded. The power lines could leave through a pair of independent (NOT bifilar) chokes, so could telco lines. The antenna leads might leave that point through chokes also (bifilar or sleeve type).

Then the desk ground would only serve to tie the cabinets together for safety or RF shield voltage differentials at the equipment. The desk equipment would not be subjected to ground loop voltage differentials from lightning or RF even if the ground connection any piece of equipment was accidentally removed.

The worse thing is to bring in things at opposite ends of the area. That's what people should avoid.

Ryan: Ten meters is pretty bad at the bottem of the sun spot cycle. You might hear some signals in the afternoon, but there isn't much propagation. I'd invest in a set of code practice tapes, upgrade to General and you'll be able to use that R7 on the lower bands where there's propagation. 73, Jim W9WU

>Bob NO6B

Bob,

That is a little extreme, although a popular route to take in some coastal states like CA and NY. I can not tell you how annoying it is to travel to California and find so many closed repeaters and closed autopatches. I, for one, would not continue to support the Arizona Repeater Association, if they closed their repeaters or autopatches.

The ARA has about 1100 dues paying members, and all our repeaters and FIVE autopatches in central Arizona are open to ALL licensed amateurs. Please feel free to use them when you are visiting Phoenix. BTW it's gonna be 80 degrees and sunny here today! I hope all you people in the rest of the US are enjoying your snow and record cold temperatures!

Also, please feel free to use the ThunderBird ARC repeater when in NW Phoenix on 145.43 (-) (no pl). :) We need a better antenna, so it's range is limited, for now. For those of you who are familiar with the area, this repeater is located on Phoenix General Hospital, I-17 and Beardsley Rd.

I want to buy a CW filter for my ICOM Ham Radio.

This can be the 9 MHz series, like the

FL32 (500 Hz BW), or the
FL63 (250 Hz BW),

Or, the FL52A (500Hz BW) for the 455KHz IF.

These fit several of the ICOM radios. Mine is the 751.

How much?

Jerry W4UKU flanders@groupz.net

>"unique".

Ok, here is more variables in the system, voltage, SWR, reactance, impedance?

One of my rigs is an HTX-202 (like 10,000) others out there. What do you
think would happen to the fingerprint if I ran on batterys, weak batterys,
12v from the car, on 13.8 with a smidge of ac ripple? Hi power,
low power, an antenna with high swr? Duck? An antenna with a capacitor in
series, started to tx while holding the antenna with my hand then releasing
it? When the radio is cold?

I would think that the fingerprints would be quite unstable unless you always
used the same exact antenna, voltage, temp, location...

I think that only permitting signals that had a matching fingerprint as
opposed to letting all signals except x,y,z would work better.

1970. Re: DC connectors and wiring

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-06 00:00:00 UTC
From: lp@intele.net
Message-ID: <4f6kvd$6cr@vodka.intele.net>
Source record: 206030

Our ARES group here in Utah County, Utah has standardized on the Anderson Power Pole connectors. They are fairly easy to assemble and can handle 30A, though I haven't seen any test results done on them. The only concern I would have with a 10A connector is that my Kenwood 733 runs typically at 8A on high power, and if you have a packet setup or more than one radio running high power you don't run into problems like one would with a 10A connector.

Our group started using these connectors years ago, and I have no idea why they made the decision to use these over the other myriad of connectors out there, but they do some in handy.

Just one more way to go!

: Technically true. However, in practical situations using the MIC
: gain control to control power is troublesome. So maybe this is a
: different problem. I know that on my 440 it is next to impossible
: to get it down to a reliable 5 watts PEP output using the MIC
: gain, since any movement in the area of the mike itself will
: change the PEP output substantially. There is no setting where I
: can just sit back and ragchew - counting on about 5 watts PEP
: output. It will vary from 2 watts to 25 watts or more. Now, by
: using the audio processor I can get it a little closer, since
: the audio level is held more steady. By using ALC control, I
: get much closer to what I want...which is the way other
: transceivers do it? Does anyone know? Is the audio circuit in
: the 440 just unstable because the MIC gain is not a reliable,
: steady power control?

No, the problem is that you are not providing a steady input level to
the mike. The rig is performing exactly as it should.

Now, if you used a speech processor, such as one that compressed your
voice - the output level would be much more steady. However, those
circuits tend to increase background noise, as they attempt to adjust
ALL sounds to the same level.

Have you looked at the output waveform on a scope? I suspect that it would
show flattopping of your signal. This is just a guess, as I am not going to
try wiring a battery to the ALC on my rig to find out.

>Hello Michael,
I know what your describing. I no longer have my VFO-230, but if it's the same
digital model that I had, once in a while it goes senile. There is a small battery inside
for keeping the memory alive. After many years the battery start to die. I think
it's one of those flat round type like you see on a computer board. About the size
of two quarters back to back. Anyway, try changing the battery, then connect
the TS-830S and the VFO, and power up the 830. The 830 should send a 'reset'
to the 230 and resync the vfo's. Hope that takes care of it. If not, check out that
interconnect cable for an open line....

>--
The frequency ranges 450.0--450.9 Mhz and 455.0--455.9 Mhz are assigned
to commercial broadcasters for remote pickup use and occasionally a
studio-to-transmitter link (STL). Most STL's nowadays are at 950 Mhz or
higher, but the 450 and 455 ranges are used widely for remote broadcasts.
The 10-20 second delay you mention also indicates remote broadcast use as
stations quite often "build in" this delay to avoid undesirable comments
from going out over the air. This is especially true of
call-in programs.

That's certainly correct for some lamps Zak. Exotic? How about
"challenging"?

But Denny bought lamps from several sources. The ones I know about are
Surplus Sales in Cleveland, Ohio; Mouser, and Radio Shack. The best thing
is to look carefully at the pictures, the bulb you have may vary with the
day of the week, hi.

When Prime Instruments "inherited" a bunch of weird Dentron lights from
multiple sources we never used them. It was too confusing to sort through.
Some were screw base, some minature bayonet, and some non-replaceable or
almost impossible to find for a reasonable price on the new market. The
outside of the lamps looked similar, the consistancy stopped there.

I was working for Prime when Prime retrieved parts, and I worked with
Denny for a short period of time also.

1990. ic706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-06 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9602061540.AA00827@shelob>
Source record: 206050

I had returned my IC706 for service, not related to your receive
problem. When I got it back it did not receive well on VHF.
What I found out, If I unscrewed and removed the top lid, it
worked. If the top cover is screwed down to tightly, the spring
grounding clip, on the filter switch board near the back(top)side
of the radio, which contacts the top cover, shorts the filters out
on the receiver on VHF.
To eliminate this, I reform the spring clip to protrude more upward,
then put the cover back on. Now no problems. Check this out. A lot of
the IC-706 top lids are really not screwed to tightly down. If you
really tighten them down, after installing the optional filter,
the soldered spling clip and the back filter board presses to adjacent
traces on this filter board, causing lost sensitivity.
Another way would to put some tape/insulating material around, underneath
this clip to prevent it from touching the traces underneath it.
This grounding clip is necessary and has to touch the top cover for
stable operation(no ground loops).
Hope this helps you.

You're paying an awfully high price for ignorance. The new Icom R1 and the rest of their wideband receiver line can be cell restored. One just has to know how to do it. It really doesn't matter whether or not this particulat R1 is unblocked, $500.00 is outrageously expensive and anyone stupid enough to pay that because it's "unblocked" is a moron. A little knowledge might be worth just as much as that R7000.

I've had my FT51 apart, and I saw no battery, although I wasn't
looking for one, at the time. The Doc's do say that memory is
non-volatile...EEPROM.

BUT, I've noticed that a low voltage condition in the FT51R as well as
the FT11R can cause erratic behavior, such as the radio cycling on and
off, as well as the memory getting scrambled.

1993. Kenwood TH-79A/D Operation Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-06 00:00:00 UTC
From: G J Lundy <glundy@infocom.net>
Message-ID: <4f7u4a$1pb@gryphon.phoenix.net>
Source record: 206053

I have two TH79A/Ds. The manual seems pretty slim on all of the capabilities of the radio. A friend of mine, who builds radios, has told me that all such HT's are build with many additional features that go undocumented (e.g., hyperscan, selectable frequency scan from memory, etc.).

Does anyone know if there is a more complete version of the TH79AD manual available; or if there "are" additional features and options for the radio that are not specifically mentioned in the general user manual.

Does anyone know "how" to extend the frequency range for both receive/broadcast on the TH79AD. The Alinco is expanded by simply terminating a couple of extraneous circuits.. then the radio can be used outside the manufacturing set limits.

Sure would appreciate any help that can be given.

For Sale:

Yaesu FT-290RII all mode 2meter xcvr
MH-15C8 DTMF Mike
FL-2025 Linear Amplifier (25 Watts)
MMB-31 Mobile Mounting Bracket (Never used)

Radio is in good condition. Never mounted in my car.
I have just a few days to sell this radio.
I am asking $450 (OBO)+ 5 for shipping (fedex overnight).

I will ship overnight via fedex when I receive your certified
funds check or your personal check clears your bank. COD is
okay also if you want to pay for the charges.

If you are interested, please give me a call at 303-360-4001
between 0800-1600 MDT or in the evening at 303-841-4369.
Thanks,
Eddie Tuggle, KG0XB

1995. IC706 - how many versions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-07 00:00:00 UTC
From: pjessop@dircon.co.uk
Message-ID: <4f8shv$kjg@newsgate.dircon.co.uk>
Source record: 205935

I've been following the discussions on the IC706 with interest. I think I'll get one as a return to amateur radio after ten years (still kept my licence though). I'm tempted to buy in the US ona a visit next week.

Is the rig I would buy in the US any different from a European spec rig? I know it won't do 70MHz (yet) but are there any things like channel spacings which are not configurable? At least there's no 240v supply to worry about.

Also, what's a reasonable price? I've seen $1200 quoted on a web page but was quoted $1249 on the 'phone. Are these haggle-able?

>>IC-706.....60wpm plus. It's keyer won't go any faster.

What about the relay noise in the 706 when in qsk
I heard that the 706 used a very noisey mechanical relay (as in the
737,A) instead of solid state switching. That to me is very
distracting. QSK should be silent with fast recovery, no pops, clicks,
or loud RELAY NOISE. I would like a 706, but have not bought one due
to the relay noise I have heard reported.

Being a fairly new ham I am not as familiar with all of the HF rigs out there as I hope to become. There is a member of our club who has upgraded his station and will soon be selling an Icom 751. I would like any information or opinion on this particular radio. I am particularly interested to know if it is a good radio for CW work, if it has any known inherent inadequacies, is it too much or too little radio for one with little experience but high hopes and of course, what is an equitable price for a used 751 in good to very good shape.

Any, and all help is greatly appreciated.

For all current owners of ACC equipment (Advanced Computer Controls), there is now a listserver remailer operated by the same folks who operate the LINKCOM remailer...

To subscribe, send a msg to "majordomo@engrng.pitt.edu"

In the BODY of the msg, put ONLY the following:

subscribe acc
end

Then make a note as to WHY you want to subscribe....if you are an owner of ACC gear, state it and mention model and S/N if possible....OR if you are part of a group that operates an ACC system, note that...

This remailer is for ACC operators only....PLEASE do not try to subscribe if you dont own or maintain any ACC equipment...bandwidth is limited...

Linkcom's remailer is at the same site...use the same format as above but in the body of the msg, use "subscribe link"

>Even at UHF frequencies.

The loss isn't generated within the connector itself; it's a function
of the SWR that's created on the cable that precedes it.

I wouldn't personally use a PL259 on the end of any 50 ohm antenna
cable longer than two or three miles. ;)

Well, leave it to ICOM to come up with yet ANOTHER GREAT radio.

I am a member of the Mississippi Wing Civil Air Patrol - the official auxiliary of the U.S. Air Force. We operate just above and below the amateur 2m band. Can this radio be modified for that operation (143.000-144.00 and 148.000-149.000). We also operate on 4469 and 7635. Just out of the 80 and 40 meg bands. Can this radio work out of the box on all these frequencies or does it need to be modified. If it needs to be modified, can someone provide me with the information on how to do the mod. I would also be interested on if the radio can be modified for the public service band of 150 mhz. Any help would be appreciated.

>
>This part is true. For example, I had two Yaesu FT5100's. They had
>very different fingerprints.

I believe those two radios had different fingerprints, but I don't
believe this is anywhere near conclusive proof that all radios have
unique fingerprints. In fact, I assert that radios of the same
design and production run will have a tendency to be quite similar,
and the odds of two radios having nearly identical fingerprints
would be significant.

When you add in the fact that the automatic ID algorithm necessarily
allows some margin for change, the odds of a false positive are
increased.

>> Also, component ageing and temperature variation can cause
>> considerable drift over time, and I haven't seen any evidence that
>> this drift isn't great enough to change the "fingerprint" of the
>> radio.
>
>My primary use of such a device has been short-term capturing of

>when someone gets on at 2AM to kerchunk for 30 minutes straight,
>capture the prints and compare them against the "known" prints
>I'll capture later on, or those I've captured earlier.

In this application, component drift is probably not significant,
though temperature drift can still be a factor (i.e., jammer gets
in cold auto, kerchunks a few times while the radio is 0 degrees C,
you get a sample, then, an hour later, she kerchunks again, but the
radio has warmed up to 25C.

>> Another factor worth mentioning is that the characteristics of a
>> PLL may change considerably as you change frequency, due to variation
>> in gain of the VCO. A fingerprint taken at 144.0MHz may not
>> "match" a fingerprint taken at 148.0MHz, for instance.

>
>I have found that *ANY* change in frequency requires resampling
>all xmitters. Samples from one frequency are usually worthless on a
>second frequency, unless it is really close.

Though I mentioned changing VCO gain as the major variable, even a
perfectly linear VCO tuning curve doesn't eliminate changes in
the PLL characteristics as you change frequency. This is because
the loop natural frequency and damping (the primary components of
the "fingerprint") are both dependent on the VCO gain *and* the
loop divisor. The loop natural frequency is generally inversely
proportional to the root of the loop divisor, and generally proportional
to the root of the gain of the VCO. So, for a 2m transceiver using
a single loop synthesizer with a 5KHz reference frequency, the loop divisor
(N) will range from 28,800 (at 144MHz) to 29,600 (at 148MHz); calculating
sqrt(29600/28800) we get 1.0138. We expect the loop natural frequency
to decrease about 1.4% at 148MHz compared to 144Mhz. The damping
factor will change about the same amount.

Now, take that same synthesizer and assume that the VCO gain is 3x
greater at 144MHz than at 148MHz, which is not unreasonable. The
square root of 3 is about 1.73; this means the loop natural frequency
will be nearly 75% greater at 144MHz compared to 148MHz.

If a radio has a very linear VCO tuning curve, the fingerprint will
not vary significantly from one frequency to the next in the 2m band,
but this would be the rare exception.

O>> I'm also interested in how accurate the software algorithms are
>> that are used to compare a captured fingerprint with stored fingerprints.
>> I can't help but speculate these algorithms generate a likelihood
>> of match measurement, and some arbritary level is used as a decision
>> point (like, say 90% likelihood of match).
>
>The TXID don't really have any "comparison" software (they have a
>crude "match" option in their capture program, but it isn't sophisticated
>at all.)

Don Moser of Motron (maker of the TXiD, http://www.motron.com) described
the match algorithm to me; it is a simple mathematical correlation
function that yields a number; the smaller the number, the closer
the "match". The decision point for this function is configurable.

>Essentially each "fingerprint" is nothing more than a series of voltage
>readings off a receiver's discriminator that provide you with a
>measurement of where a xmitter's signal is within the passband. "Matching"
>this print is a difficult process -- you can have a "match" strictly on
>the values themselves, or you can have a "match" on the relative differences
>from one measurement to another -- depends entirely on how you want to
>do it. I don't know anyone who has written "match" software for the
>TXID unit as of this time.

If this is the Motron unit, the match software is provided.

Actually doing an automated match of fingerprint isn't that complicated,
in theory. You capture a signature, and you look it up in a database
of signatures to see which one correlates most closey. If the correlation
is good enough, you declare a "match". The Motron system uses the
actual waveform with a fudge factor for transmitter/receiver frequency
drift, though I suspect I'd be likely to do an FFT of the captured
waveform first, since this should allow transmitter/receiver drift
to be dealt with more elegantly. The important thing to realize is
that a "match" just means a very good correlation, not an exact
match.

2015. Need Tech Advice to Operate Hickok 752 Tube Tester - ad_752.001 [1/1]

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-07 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <4fb9ke$o6u@csu-b.csuohio.edu>
Source record: 205955

Need Advice on Operating a Hickok 752. I just got the unit and do not have an owners/operators manual. I would appreciate the advice from anyone who cares to tell me how to do the following tests on the unit. Any advice you can offer will be greatly appreciated.

What I've figured out.

1. How to set the line voltage on startup.
2. How to setup the unit from the tube chart to due a dynamic mutual conductance test.

What I haven't figured out and need help with:

1. How do you do a tube short test?

2. How do you do an amp tube life test?

3. How do you do a gas test?

4. What is the leakage knob? Is that the same as an emissions test?

5. What is the knob designated VR for?

6. Concerning the two fuse bulbs. Are they supposed to light up? The unit works, but neither bulb appears to illuminate -- is that a problem?

7. On start up I can't get the needle on the meter's centered line voltage line mark to align perfectly vertical as it should. It is off one meter gradation to the right. Does this mean the unit may need a tube or what are the other possibilities?

8. Does the meter light up on the 752 (maybe just a bad bulb, I have not taken it apart yet)? I know the 752A's meter lights up?

Apparently there is a series of 752's. I have the 752. I have seen a 752A. What are the differences with these and later series models if any?

Can any 752 use the same tube set up charts?

I want to thank you kindly for whatever help you can render. Again, it is appreciated.

I also had a TS440S. I agree you cannot vary the SSB output power on a TS440S except by controling the ALC voltage at the back of the radio. I built myself a little box for controling the ALC when I still had the 440, used it for QRP on HF.

The mic gain is a very unreliable and non-linear way of controlling the 'rf' power. It is not meant for that. Try using the mic gain when driving a 10mW transverter !

I went thru this whole story years ago - don't waste time with the mic gain control.

I now have a ts690s: kenwood decided to implement a rf output control on it, it works wonderful. Why have they decided to do it ? Make up your own mind.

If rugged is teh criterea, buy commercial. Motorolo, Midland, etc. It is a little more hassle since you have to crystal or have them programed (vintage), but can't compare ANY ! amateur products to good old solid commercial. Keep a watch on this list and you will see them all the time...

For what it is worth.....

: the coverage of all bands.
: The 2m unit works till 145.999.
: My question is: how to extend till 147.999 ?

Yes. Hold the MCK (2) button down while turning on the rig. That should change it to 144-147.99 mhz operation unless they've done something on your unit's filtering to restrict it otherwise.

: The same problem is on the other unit (430 Mhz)!
:

Well, holding the AC (0) button down toggles it from 430 to 440 on the display, but there *ARE* component changes inside the module which prevents operation outside the original band. Even though the display may say 440, it's still operating on 430. Sorry.

: It's also possible to extend TX capabilities ?
:

The 2M change covers both Rx and Tx. I believe Yaesu has these different band restrictions for different world markets. I am not aware of what the restrictions are in your part of the world, so be careful.

Enjoy,

Hi Tom,

At any certain speed, each code element (dot or dash) is supposed to exist for a fixed amount of time. The same is true of the spaces between them. In QSK operation, each element could therefore be called a "transmit unit", and each space could be called a "receive unit". In order to achieve perfect QSK, neither of the units can be allowed to change.

Because it is impossible for the switchover from transmit to receive (and from receive to transmit) to occur in an infinitely small amount of time, QSK operation will always degrade the transmit unit, the receive unit, or both, to some degree. That's true even when a separate receiver and transmitter are being used with an electronic antenna switch. If nothing else, the receiver must be desensitized during the time period of the transmit unit. That disturbs the equilibrium of the AGC, as well as independent stages which may see a change in effective operating bias between the transmit and receive condition.

This agrees with what you've said, but I wanted to point out that like most things, it's a matter of degree. To add to your last statement, I think it's reasonable to add that a rig could have acceptable TX keying reproduction, and acceptable RX recovery. I'm using the word "acceptable' as opposed to "poor" or "perfect", because if the T/R switching time is sufficiently short, it could occupy an area that extends partway into the transmit unit, and partway into the receive unit, perhaps without occupying a significant portion of either.

Like you say, old or new technology isn't the reason for good or bad QSK, but I don't think that will always be the case. If the manufacturers were willing to apply it, digital delay technology could provide variable placement of the switchover time. That would allow it to be "centered" between the transmit and receive units, and

perhaps even to be varied by the operator, in terms of placement, as a function of code speed.

You're also right about the test method changing the result. I like Steve's test results, but I'm wondering if there's not another, more definitive method for establishing some sort of standards? For instance, it's simple enough to check CW reproduction on transmit with a scope. In fact, I've done that with my rig, and there's literally no detectable difference between dot/dash length at the keyboard and dot/dash length at the RF output connector from 5 WPM to at least 60 WPM. This tells me the switchover time (whatever that may be) is subtracting from the receive units, not the transmit units.

After reading your post, I went back to the rig and tuned in a strong carrier on the air. Then, I set my keyboard for 60 WPM and sent a long string of "fives" and another long string of "zeros". No matter how hard I tried, I couldn't tell if I was actually still hearing the carrier between the elements, or only during the longer space between each character. So, then it occured to me that I could do a quick modification to my homnebrew keyer, so that I could send an uninterrupted string of dots or dashes at 60 WPM. However, even that wouldn't tell me the degree to which each receive unit is being clipped (unless of course I was unable to hear the carrier at all).

With the preceding in mind, I'd like to propose a different method for measuring QSK effectiveness. Any comments or criticisms of the techniques are welcome.

First, check the transmit units with a dual-trace scope synced to the modulator (keyer, keyboard, etc.). Measure the width of each code element at the RF output connector and compare it to the width of the elements at the modulator. In order to establish a standard measurement procedure, and to accomodate the shaping of the RF output waveform, do not include any portion of the output in the width measurement that is more than (pick a number) 6 dB below full output.

To check receive units, apply an unmodulated carrier to the input of the receiver at a level of (pick a number) 50 uV. Tune in the carrier so that the audio frequency from the receiver is equal to the offset applied by the rig's transmitter in CW. This is merely to achieve some semblance of "normal" operating conditions. Now disable the sidetone oscillator, but be sure AGC is set to the position normally used for medium-to-strong CW (disabling the AGC might provide an unrealistic and optimistic result, especially considering that most people only use QSK when signals are reasonably good). Also, unless the transceiver has an auxillary receive antenna input, the carrier level or equivalent control will have to be set to minimum (or another method found to disable drive to the PA) to avoid damaging the signal generator. The latter procedure may not provide quite as accurate a result as with the transmitter "live", but it will suffice for lack of a better way.

Now sync the scope to the modulator and observe the output of the modulator on one trace while measuring the width of the received audio pulses on the other trace. Again, to account for waveshaping of the received audio (whether intentional or not), do not include any portion of the waveform that is more than 6 dB below full audio output. Measure separately any portion of the waveshape that overshoots full steady-state RX output, or consists of noise rather than the recovered sinewave, and note either of those characteristics as separate data.

Well, that's about it. I've got a rig open downstairs even as I write this, so I think I'll check the "receive units" in a few days before I button it up. I don't have the generator needed to check it at a professional level, but I can get close.

I know this all sounds somewhat complicated, but it's really a pretty simple procedure. Steve, if you're listening, your comments would be appreciated too. You sponsored the original cookoff and it would be interesting to know how the results of tests with instrumentation compare to your on-air evaluations.

Speaking of cookoffs, I think it's about time to make another batch of Texas chili. Anyone got any real jalapenos they'll ship to PA? The ones they sell up here are about as potent as the current Administration. ;)

There are two more programs that I am aware of.
The first was published in 73 magazine with source it is called ROBOCOPY.
This one is a copy/read only program with source in "C".

I have also used a program called CW version 1.04 based on the robocopy
program. This one was written by W0NFU, has no source code with it, runs
on an IBM PC.
Both of these programs require a seperate interface to your HF rig.

Nice test...but one key ingredient is missing (no pun intended): What does the keyed wave form look like on these radios. It's very easy to design a relay-switched radio with very fast T/R recovery times, but generally, a shortening of the transmitted keyed elements is observed and heard.

>circuits tend to increase background noise, as they attempt to adjust
>ALL sounds to the same level.

That is what I normally did when I attempted to use my 440 for QRP SSB.
However, though my cheapo MFJ "Peak Reading" wattmeter showed pretty
steady 5 watts PEP output, I got a Palomar peak reading wattmeter
(it was digital? used discrete led's to show power output) that
seemed to respond much better and saw that my PEP output was still
varying widely depending on how I spoke to the mike and the time
of day, maybe the phase of the moon. The 440 compressor is an
audio compressor, but gets reasonable reports from critical guys.

There seem to be a lot of positive comments about the use of this pipe, but I don't see even one thing relating to this person's RF problem. The pipe probably isn't going to cure that, no matter how big it is. I also haven't seen anyone questioning the soil conductivity. Most Amateur ground systems are worthless for RF, unless the QTH is a saltwater marsh.

Fix the real problem and the #10 ground will work just fine.

>* vannossc@ipssmail.sch.ge.com ** are my own. *
>**

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.

+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX

+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach either one of the installed diodes, the CPU will reset and you'll lose ALL of your memories. (found that out the hard way...) D15 doesn't seem to affect the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

This part is true. For example, I had two Yaesu FT5100's. They had
very different fingerprints.

> Also, component ageing and temperature variation can cause
> considerable drift over time, and I haven't seen any evidence that
> this drift isn't great enough to change the "fingerprint" of the

My primary use of such a device has been short-term capturing of
scumbags. Set up the device, let it monitor the repeater, and then
when someone gets on at 2AM to kerchunk for 30 minutes straight,
capture the prints and compare them against the "known" prints
I'll capture later on, or those I've captured earlier.

> Another factor worth mentioning is that the characteristics of a
> PLL may change considerably as you change frequency, due to variation
> in gain of the VCO. A fingerprint taken at 144.0MHz may not
> "match" a fingerprint taken at 148.0MHz, for instance.

I have found that *ANY* change in frequency requires resampling
all xmitters. Samples from one frequency are usually worthless on a
second frequency, unless it is really close.

> I'm also interested in how accurate the software algorithms are
> that are used to compare a captured fingerprint with stored fingerprints.
> I can't help but speculate these algorithms generate a likelihood
> of match measurement, and some arbritary level is used as a decision
> point (like, say 90% likelihood of match).

The TXID don't really have any "comparison" software (they have a
crude "match" option in their capture program, but it isn't sophisticated
at all.)

Essentially each "fingerprint" is nothing more than a series of voltage
readings off a receiver's discriminator that provide you with a
measurement of where a xmitter's signal is within the passband. "Matching"
this print is a difficult process -- you can have a "match" strictly on
the values themselves, or you can have a "match" on the relative differences

from one measurement to another -- depends entirely on how you want to do it. I don't know anyone who has written "match" software for the TXID unit as of this time.

>
>73,
>Jack WB3U

Hi Jack,

The problem is mostly a lack of design skill, not technology. Some engineers just have no clue how CW works and should sound, and don't bother to research it! Getting them to understand the problem is difficult.

It's more than just "hearing an interuption".

Important issues are:

1.) Sequencing of the external PA control line.

2.) Clicks, edge squaring, or damage from hot switching.

3.) Modification of weight.

4.) Receive recovery time.

5.) Receive window width.

6.) VCO settling time.

Just about every rig falls out on more than one of these. Sometimes the test method changes the result.

For example, I have a rig that seems excellent until I use a 100 kHz split on QSK to work JA's on 160. Then the VCO swoops to the TX freq while TX RF is on. Imagine the click that makes! ! I can't use the rig on QSK with more than a 50 kHz split, or it clicks like crazy when the VCO swoops into lock.

In general, rigs with poor TX keying reproduction have super RX recovery. Rigs with poor recovery sound much better on TX. Take your pick, but don't expect it all.

I have an unwired ham buddy who is considering an Eto 91B and is soliciting any opinions/experiences on this relatively new amplifier or Eto in general. His name is Paul Elliott (W5DM). Replies on the newgroup or by e-mail to me would be great.

Thank you.

Larry (NU5M)

I have a friend looking for the tone module (PL) for a KENWOOD TR-7730.
Anyone have one around or an old busted TR-7730 with a tone module in
it.

We had to PL the local repeater and phone patch and now he is lokced
out.

Thanks,

From: rgamind@relay.nswc.navy.mil
Message-ID: <1996Feb7.145358.2410@relay.nswc.navy.mil>
Source record: 205975

Hello All,

I am posting this question for my father-in-law. He just received his Tech No-Code licence and wants to purchase a handheld radio. He is considering the Yaesu FFT-10/A16D since it has some nice features and is also MIL-SPEC. He plans to use the radio when hunting to keep in contact with his wife in case something happens. The question is this: is this the best radio for what he wants (rugged, weatherproof, etc)? Can a few of you make some other recommendations?

Thanks is advance for everyone's help.

I am writing this message for a friend who isn't familiar with newsgroups yet. Please send any responses addressed to Richard (N7BDM) his email address is: sallym@pioneer.nevada.edu.

Richard is planing to buy a dual band mobile radio (2M/70CM) in the near future. He has been inactive in the hobby for several years and isn't sure which brand to purchase. Please send any comments you have on first hand experience with the current radios available today.

Thanks and 73.

2038. Re: Kenwood 733A poor intermod?

Newsgroup: rec.radio.amateur.equipment

Source record: 205978
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have two Kenwood 732s and an Icom 2350. The Kenwoods are, by
far, much better atI/M rejection than the Icom.

Don't kave any experience with Yaesu .... but .... a local
reports it worse than the Kenwood.

Make no mistake, I/M does and will exist. You must either use
CTCSS or learn to live with it.

2039. Yaesu FT530 BNC Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-07 00:00:00 UTC
From: jwdxt@boco.co.gov
Message-ID: <4fb229$6qs@news-1.boco.co.gov>
Source record: 205979

I have two FT-530s which have both developed a problem with their BNC connectors. New rubber duck antennas and new BNC connectors on my mobile antennas all act the same - POOR. I can drastically improve my signal by pushing the antenna down harder on the BNC connector. I don't see any visible signs of damage or corrosion on the outside of the radios, and a cursory glance inside does not seem to reveal anything out of the ordinary.

Is it normal for BNC's to "wear out"? One of these radio's I bought new about 2 years ago, and the other I bought used and appears to be considerably older. They both developed this problem within a couple of weeks of each other. I admit I use them hard, swapping antennas frequently.

Does anyone have any experience with replacing the radio's BNC assembly, or do you recommend sending it in to Yae$u Repair?

Thanks in advance,
Jim Deeming

>because I'm not familiar with all the mechanisms and accessories
>needed to assemble the system.

The nomenclature used by Teletype Corporation is:
KSR = Keyboard Send and Receive, i.e., no tape
ASR = Automatic Send and Receive, i.e., has tape perf and tape player.

I started my RTTY hobby in 1969 with a model 19 KSR and worked my way up through all the various mechanical printers, including 28's (ASR and KSR) and a model 32 (Baudot) and 33 (ASCII) printer. At the peak, I had 3 model 28KSRs and 1 28ASR. You should be able to get these today for free. (Some people refer to the era of mechanical printers as "steam RTTY.")

Today, my printers are in the basement and my shack has all electronic equipment. I retired my last mechanical printer (a Model 32ASR) about 1985. As I see it, the pluses/minuses are:

Pluses:

You can't match the sound and smell (warm machine oil, paper, ink).
Historical accuracy
Cheap printer (probably free)
Can find a terminal unit at very low cost, such as an old ST-6
Trouble shooting requires a set of spring gauges and feeler gauges, not expensive electronic equipment

Minuses:

Maintenance can be a problem. The machines do require periodic cleaning and adjustment.
Mode limits. You can only do Baudot. (It is possible to do multiple speeds, either with a 3-speed mechanical gear set in a model 28, or with a speed converting TU or external speed converter.) (You can, of course, get an ASCII printer, such as a Model 33 and find a Baudot to ASCII converter.) But the more exotic modes, e.g., PACTOR are out.
Noise
Size
Weight
Consumes paper, paper tape and ribbons. (You can re-ink the ribbon; use NCR cash register ink.)

If you do decide to go mechanical printers, I would look for a model 28ASR. The model 32 machines, while newer, were never the mechanical equal of the 28 series. Too much plastic in the 32/33 line. You might also want to look for a model 28 reperf for recording incoming signals.

Have you seen this AD in any HAM RADIO Magazines??

PacketCluster for DXers and Contesters! Multi-user, multi node
networking software features real-time messaging, annoucements, DX
alerts,e/mail, linking, and much more. Up to 64 users can connect to your
node using a radio, TNC and PC or terminal. Hardware also available.

This company is called Pavillion Software.....

For everyones information they don't give any support on the product
that they claim they sell! Also, would you order from a software
company that doesn't even have the money to own a phone!! When,
you call this company all they have is a answering machine that asks
for your credit card number and what software you want.

I ordered though this company and I found out the hard way about
them... they are a bunch or scam artists who say they will send it
right out but never do. I have been waiting over 3 1/2 weeks for
software that was supposed to arrive right away and when you call
the answering machine they don't even return your calls!

I just want to warn all users that you shouldn't deal with these
scam artist and don't get ripped off from them also.

Thanks for your time and
good luck!

Jeffrey -
N9MXT1
If anything changes about my status of my software comming right away I
will let you all know.... but, for the moment nothing is heard from

2050. HELP, EFFECTIVENESS OF LINEARS ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-08 00:00:00 UTC
From: Peter Shintani <shintani@tv.sony.co.jp>
Message-ID: <4fbhqp$k49@oskgw.osk.sony.co.jp>
Source record: 205865

Hi:
I have never used a linear. Some people comments that
a linear dramatically improves the chances of a
successful long distance contact. I've heard that
a going from 100 W to 500 W gives more than
a 2 S unit or higher reading at the receiver.
I guess
that the ionosphere's reflection efficiency is
non-linear with respect to incident power.
I appreciate any and all comments.

Peter

I picked up 3 standard 2 meter ht's. They are great. All options included. Event tone squelch which will cost an extra $80 on a Yaesu. Probably the best rec. around. No intermod problems. They were selling at HRO for $200. The only down side is the extras like 12 volt adapter are not so cheap. But you can get generic batteries, chargers and mics from other companies much cheaper.

> I sold my NIR 10 and got a NIR 12. The advantage of the
>NIR 12 is that all the functions that are on the NIR 10 are available
>concurrently

Not exactly true...I have both a NIR12 and an NIR10 with ver 4 chips. The NIR10 now allows variable dynamic peaking...a very nice feature. The NIR12 has a three position switch for this function on the rear panel. While operating, feel around the back of the unit and try to find it!!!

One more thing...the model 10 has the headphone jack in the front panel and the model 12 has the jack on the rear panel!!! Why? JPS sez no room on the front. Not a good excuse.

Yes, the NIR is a bit better/smoother in the NIR12 and there is more audio gain available. The down-side is the loud buzz/thump when you power-up the model 12. No such problem on the NIR10.

I haven't decided yet which one to keep...

This sounds unlikely. With the delay placed at the transmitter and a
naughty word on it's way, does the studio then have to make a phone call to
the transmitter to ask someone to bleep it :-(

The idea of a cue link to an o/b unit or traffic helicopter gets my vote.

>
> Any, and all help is greatly appreciated.
>
> 73 de KB0TIJThe IC-751 comes in several variations: IC-751 and IC-751A, the IC-751A
is the newer model. The IC-751A comes in two vairations: with IF shift
and with PBT, the PBT is the newer model. The IC-751/A is a quadruple
conversion receiver and is very good. It comes with a 500 Hz CW filter
so it ready right out of the box. Depending on the model, options, and
condition, between $600 and $800.

Subject: Can I modify 8 ch Radius to 16 ch?

I have a couple Motorola 8 ch M208 Radius radios. I read earlier on this
newsgroup that these could be modified to the 16 ch version (M216) by simply
changing the front panel assy. This has been done, but the radio codeplug
will not accept any additional modes beyond 8 channels. What additional work
must be done to enable this mod? I hope the replacement of the entire logic
board isn't required.

Sounds like a studio transmitter link. This of course is FM between the
actual station and the main transmitting antenna.

> best guess: scanner is picking up a studio to transmitter link on an image or
> some such thing, with a delay to air at the transmitter.

This sounds unlikely. With the delay placed at the transmitter and a
naughty word on it's way, does the studio then have to make a phone call to
the transmitter to ask someone to bleep it :-(

The idea of a cue link to an o/b unit or traffic helicopter gets my vote.

Here in the USA Standard prices are about the same as YaeComWoods,
but I've had several and liked them all. The superior IMD rejection
they have is very nice, too.

Subject: HTX-202 discriminator output?

Hello All:

I have an HTX-202 that has apparently lost its audio chain. It transmits, and is apparently receiving (the S-Meter is acting appropriately when it senses a signal. :-) Can anyone point me to where I can tap the output of the discriminator? I presume that I can acquire the audio there, and pipe it to my TNC, indirectly. :-)

Thanks,
- Rich

>Anthony Giammarino - WA6HTF

I had the same problem. I sent the radio to Kenwood for warranty
repair. The problem was apparently a bad transistor, not just in my
radio, but in many of their 241A's. I had a similar problem with my
microphone -- a problem that was inherent with all 241A microphones.

It seems as if Kenwood knows that there are problems with their 241 line,
but will not recall any of them. They just hope that the owners will not
eventually stumble upon them. Then when you call them, they play
stupid. That's what bugged methe most! My $0.01 ($0.02 after taxes).

Subject: LOOKING FOR ADVICE ON CHOOSING A SERVICE MONITOR.

Hi: The sponsor of our repeaters has decided to fund the purchase of a service monitor. I've been asked to go shopping about for one. What we'll be using it for is tuning/repair of 2meter, 1.25meter, 70cm transmitters /receivers, VHF and UHF Public Safety Band portables/mobiles, duplexors, etc...

But what the heck to chose? Suggestions and recomendations, as well as opinions on reasonable prices, are requested. I've briefly used a few IFR's, Waveteks, and Motorolas but that experience is rather **limited**.

gary@ke4zv.atl.ga.us (Gary Coffman) wrote:

>And QSK CW is new technology? :-)

I agree. My vintage 1982 Cubic transceiver will work 60 wpm QSK with the best of 'em. So did my $200.00 Novice station back in 1966.

Good QSK has anything to do with age or technology. It's just a matter of whether the manufacturer bothered to do it.

Subject: What ssb rig ????

Hi,

Now that my 2/70 hand held has just packed up I was thinking about getting
a ssb rig. My first problem is what frequency to get (i'm only a B license
(above 30 Mhz only), and the second is what rig ?

I was hoping to maybe work some dx, so I was thinking about 6m, would I find
much out there (my qth is 12 miles from Gatwick airport (in a valley :{)).

To get the most out of my signal (I can't use 2 much power as I live in a
housing estate), I was thinking of using a beam, would this be the best bet ??

Sorry if these questions sound daft, but i've only ever used ssb at JOTA.

Andy, g7ueh

(before anyone suggests it, i am 'slowly' learning morse, but i need something
to play with in the mean time !!!)

Source record: 205880

I have two simple questions:

Does the "D59 HF transmit mod" open the cross band split?
The lack of cross band split is blocking the use of RS-10
and RS-12 satellites.

I have a combination of IC-706 & PS-85 which works fine except the
quite loud audible noise coming from the two continuously running
cooling fans. Has anyone made/tried/tought any sophisticated
modifiaction to put a thermostat to control the fans?

I will highly appreciate if someone could give some answers.

Kimmo W5/OH3WU

>>Ever since ICOM decided to delete the 800 - 900 MHZ coverage from its IC-R7100
>>receiver,

Just fer the record...ICOM didn't just decide to delete the 800-900
MHz coverage from any of their radios. It was our folks in Washington
D.C. who made it illegal to listen to the cellular telephone
frequencies when they modified the Communications Act of 1934.

I believe the cutoff date for the manufacture of equipment openly
capable of receiving cellular freqs is April of 1994.

Just some gee whiz info. :)

Any of you following the Atlas Radio debacle over the past year or two will be interested in this. My friend, who has had a fully paid order for the new Atlas radio for over a year, just received a letter from a company called: O. M. Radio . In it a gentleman made a number of statements, which in essence said that Atlas Radio had failed, that this gentleman had loaned Atlas Radio (startup?) money, that after looking at the books he determined that Atlas has failed (my words), and that O.M. Radio Co. is planning on developing an HF transceiver. He furthermore stated that he was "considering" honoring the deposits laid down by former Atlas Radio customers on this new product. He also said they were not taking any (new) orders at this time until a product was developed and ready for shipment.

The above are my words in recalling this letter which I read yesterday.

SM-220 was made to be used with at least the Kenwood 830. I have one
of each. The -220 is plugged into a connector on the -830 to sample
the IF. I don't think it will work without significant mods to other
receivers and am sur it won't do much by itself. Good luck.

I had the same problems described above in my 241. Mike DTMF crapped
out and the 241 display goes crazy once in a while. I found a place
on the display bezel that, if i push on it with my thumb, it will
clear the problem. Haven't tried to fix it otherwise. Tried to fix

mike and spent 12 bux for new chip...not the problem. Priced a new mike (85 bux) and finally bought a spare for a ham in CA who had his rig stolen. Still have crapped out mike (no DTMF) but everything else worx ok. Anybody got any ideas on how the working class ham can get these fixed???

2073. Yeasu CPU-2500R - need opratn. help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-08 00:00:00 UTC
From: tomk@lute.gcr.com
Message-ID: <4fbpjk$i4n@ukelele.qnet.com>
Source record: 205987

I bought a CPU-2500R used and have no manual. Most is fairly obvious,
but I have a few questions:

What does the Man/Auto toggle do?
What does the Clear/Busy toggle do?
What do the +SFT and -SFT positions on the offset switch do?
On the memory switch, what do "RM" and "KEY" stand for?
What does the button in the top right corner that says "DIL" do?

Thank you
KC4TDG

I will check here if you'd like to mail your answer: tomk@qnet.com

2074. Help looking for a linear

2076. HT and Mobile 2 M For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-08 00:00:00 UTC
From: Rick Johnson <rick@halls.com>
Message-ID: <31198F2A.296D@halls.com>
Source record: 205990

Ht is ICOM 2AT with 3 battery packs and plug in charger...
Mobile is ICOM 280 with mic and mobile hump mount ...

Both are in good condition. I use a dual band Kenwood and not these two.
Someone can get good use of either one.

The HT batteries are not charged but the unit worked great when I
borrowed another battery pack.

Asking $ 135 for each, or best reasonable offer. Shipping negotiable.

2078. Alinco DJ-G5-comments?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-08 00:00:00 UTC
From: al bolton <al@boltons.demon.co.uk>
Message-ID: <823775501snz@boltons.demon.co.uk>
Source record: 205992

Hi,

I've just bought an Alinco DJ-G5 handheld and I am quite impressed with its performance (no appalling pager cross mod like my FT530!).

I'm just interested to know other peoples' experiences with this set, especially its reliability.

I'm also interested in obtaining some accessories for it-for example a 7.2 or 9.6v nicad pack but I don't want to pay UK rip-off prices. Can anyone suggest a US nicad supplier who will do these packs at a lower price?

Any help, info or advice most gratefully received!

Source record: 205993

Hello,

Does anyone know of a US supplier of nicad packs for the Alinco DJ-G5 handheld? I'm looking for a good product at a saving on Alinco's prices in the UK. I once dealt with a firm called "Mr. Nicad" who supplied some very good packs for my Yaesu and Icom handhelds at a considerable saving on the oem manufacturers price. Unfortunately, I can't seem to find them anymore.

Any help most gratefully received.

2080. FRG9600 Recieves HF??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-08 00:00:00 UTC
From: "Michael G. Reiney" <mreiney@hevanet.com>
Message-ID: <4fckjm$rhr@vista.hevanet.com>
Source record: 205994
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I've been poking around in my Yaesu FRG9600 receiver. Nominal range is 60-965 MHZ. There's a control line labeled /OPTION. When you ground it, the display tunes from Zero to 999.999 MHZ. This line goes to the connector to a missing and undocumented option. There's a place for another antenna connector also going to this option slot. The BAND module has three extra outputs labeled HF1, HF2 and HF3.
Looks like there might have been an option to extend the coverage down to HF.

Was this option available elsewhere? Can documentation be obtained? Has anyone tried to reverse engineer this and build such an option?

I'm also looking to buy the TV option.
I need the Vacuum Fluroescent display. Mine is busted.

Thanks, Miker

>I appreciate any and all comments.

Well, actually the ionosphere can be non-linear with
respect to incident power, but it takes a *lot* more
than 500 watts to get into that region. Going from
100 watts to 500 watts is a power change of 6.99 db,
or roughly 1 S unit and a tad. (A tad is the smallest
detectable signal strength change.)

Before deciding to use enough power to create your own ionization, I
suggest you invest in some lead BVD's. Using 100 to 500 watts into an
antenna not close up and pointing your way will be both safe and linear.

From: ecgallup@mlode.com
Message-ID: <4fda40$ka@news.wco.com>
Source record: 206001

I have a couple Motorola 8 ch M208 Radius radios. I read earlier on this newsgroup that these could be modified to the 16 ch version (M216) by simply changing the front panel assy. This has been done, but the radio codeplug will not accept any additional modes beyond 8 channels. What additional work must be done to enable this mod? I hope the replacement of the entire logic board isn't required.

I have used both the Comet and MFJ, and agree that the performance of the Comet is superior to the MFJ, at least in my application. I was able to get the VSWR down to 1:1, and hold it over varied condx. The ground for both is all important!

2092. IC-2000 microphone connector FAQ (here it is!)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-09 00:00:00 UTC
From: myers@West.Sun.COM
Message-ID: <4fg5f0$3r3@abyss.West.Sun.COM>
Source record: 205806
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Here's a little contribution to those with IC-2000s. I've crossposted
to rec.radio.amateur.digital.misc for those wishing to connect a
1200 baud TNC to the IC-2000.

Please send me updates or corrections...

The IC-2000(H) microphone connector FAQ
Version 0.1 2/9/96
Maintained by Dana.Myers@West.Sun.Com

I found the following information in the IC-2000(H) service manual;
I haven't actually connected to this jack on my IC-2000H other than
the Icom microphone, so your mileage may vary.

Pins are numbered from left to right, viewing the front of the radio.

Pin
1 +8V from radio to microphone (low current capability)
2 Up/Down from mic to radio
3 Audio output from radio
4 PTT to radio (pull to ground to transmit)
5 Microphone return (grounded)
6 Microphone (input to radio)
7 Ground
8 Not connected

Notes:

* The +8V source looks like it is intended to run the DTMF encoder in
the standard Icom microphone. I wouldn't draw more than 10mA or
so from this pin.

* The up/down signal appears to be an analog input; the service manual
says "Up: 5.0V, Down: 0.0V, Off: 5.0V", but I believe this is an error;
I suspect it is more like 5.0V for up, 0V for down and 2.5V for off,
but I haven't measured it yet. Under no circumstances exceed 5V
on this line, since it is connected to the embedded microcomputer,
and make certain to include some series resistance, say 1k.

* The audio output is a fixed level, de-emphasized signal, it looks
like it will drive loads down to 600 ohms, though I'd suggest the
higher the impedance, the better. This should just connect directly
to the input of most 1200 baud TNCs for packet; it is not usable
for 9600 baud.

* The microphone impedance is specified at 600 ohms.

The 8875, as used in the MLA-2500, is cooled by air blowing across the tube without the use of chimneys. The 8874 is cooled by using a chimney with a pressurized chassis. Unless the 8874 is cooled in this manner it would not last very long. There is also another version, the 8873, which is conduction cooled; this tube was used by Heath in the SB-230 amplifier many years ago. All of these tubes are in the same price class, about $350 a piece. As far as electrical characterics are concerned, they are all the same, the only difference being the external anode structure.

HF only.

>2. What is the value of this beast?

Well we know at least one person who swapped an 11 meter rig for one. :-)
But seriously, this is a pretty good tuner, and is probably worth
about $100-$200.

>3. Where might I find a manual?

Manual? You don't need a manual (and Dentron's manual was useless anyway).
Its operation is self-explanatory. Just peak the inductor for maximum
noise on receive, and adjust the capacitors for lowest SWR and highest
forward power when transmitting. (You may have to change the inductor
setting one step one way or the other from maximum noise to get best
output and SWR. Don't switch the inductance under drive.) When you find
good settings for each band *write them down*, and it'll be a lot easier
to get back to them when you use that band again.

Source record: 205814

Hi Peter;

Doubling your power will only give a 3dbm increase. That is basic Physics. dbm = 10 log p1/p2.
dbv = 20 log v1/v2. The path loss is a complex function, but the ionosphere is not affected by
the incident power level from an amateur signal.

As far as "S" readings are concerned, about all that can be said, is that they will increase
somewhat when the amplifier is turned on.

The single most important factor in radiating a good signal is having a good antenna. The "soft
side" of all of this, is that if you have an amplifier which dims the lights when you throw it
on-line, and throws off a lot of oily hot air from its' cooling fan, and has 4-1000 tubes with
the plate glowing almost yellow white, and old 972 mercury rectifiers flashing blue light with
your voice peaks, you personally, will feel a bigger thrill from the hobby!

Happy DXing! 73 - K9JDU

2101. New FT40 audio only clear in 1/2 Deviation??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-09 00:00:00 UTC
From: knappsm@crablegs.cig.mot.com
Message-ID: <4fgc7r$6u5@newdelph.cig.mot.com>
Source record: 205815

Hello,

I just got a new FT40 and like it very much. Last night I was talking to a friend and he said the audio sounded distorted and overmodulated. I was not talking too loud and had moved the radio 3 ft from my mouth, but he still said the audio sounds poor. So I tried the half deviation mode (menu -22-) and that cleared the problem right up.

Should I be concerned that my radio is out of spec? Or is this normal?

Hi: I know that some crystal makers can take a crystal for whicvh you know
the resulting tx/rx frequency, and figure out how to spec crystals for
another resulting tx or rx frequency. There's quite a few outfits out there,
the one I'm familiar with is JAN Crystal at 1-800-JAN-XTAL.

Good luck,

2105. Re: YEASU FTV-707 Transverter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-09 00:00:00 UTC
From: K6EID <k6eid@avana.net>
Message-ID: <NEWTNews.823913721.1536.k6eid@k6eid.avana.net>
Source record: 205819

I have a like new FTV-707 transverter with the 6 meter and
2 meter modules. Asking $350/OBO.

I used it with my FT-757GX. Technical info follows:

The transverter works on all the modes of the HF rig
and there are modules for 50, 144, and 430 mHz. It can
operate satellite modes with full duplex operation
between 28, 144, and 435 mHz. It includes repeater
splits on all repeater bands. It permits use frm
50-54 mHz, 144-148 mhz, and 430-440 mHz. It's power
input is 20 watts on SSB and CW and 5 watts on AM/FM.
Its input range is 28 to 30 mHz.

The only interconnections
between the HF rig and the transverter are a phono
connector cable frm an RF output jack on the HF rig ,
the DC power cord and a coax from the HF antenna 259
connector to the transverter. Appears that it
might work on any rig that has those kind of
connections. The RF output jack on the 757 provides a
low level RF output from an early stage of the xmtr. Power
level is about -6 dBm (0.1 Vrms) at 50 ohms.

2106. Microphone/Speaker Plug for FT-10R

Date: 1996-02-09 00:00:00 UTC
From: byoung@qni.com
Message-ID: <4fgj7q$b5s@suba01.suba.com>
Source record: 205820

Folks,

I've got a nice, new FT-10R that I'm *VERY* fond of...

My only problem is finding the "oddball" plug for the
microphone/speaker jack so that I can wire up a TNC
and a second-hand spreaker/mic.

It's a 3.5mm four conductor mini phono plug. I've tried
my local vendors, a number of catalogs, and (believe
it or not!) Yaesu themselves. Nobody has the part.

Suggestions?

Many years ago I modified a Yaesu RH2700 for extended receive. All I got for my trouble was to extend 2M up to 153.40MHz. 440 didn't go extend as I remember. The mod was to re-locate some diodes in the front panel control board which was a bitch (as I remember). The one thing that I do remember was after it was all done, it wasn't worth it. Way too much work for way too little gain.

Since the Motron TXiD system connects to discriminator output, it is
only sensitive to variations in carrier phase/frequency, and
insensitive to variations in amplitude.

>Gine Motron a call and they will send literature. I believe they sell a full
>manual for $10.00 which has both a good technology description as well as the

I had an excellent chat with Don Moser of Motron on this topic, and he mentioned his new web page: http://www.motron.com.

Bottom line is: not every radio is certain to have a unique ID, TXiD is a very powerful tool as part of evidence collection but can not be treated as infallible.

2112. FT-10R ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-09 00:00:00 UTC
From: vvv@radio.stack.serpukhov.su
Message-ID: <4fep9l$6o2@ns.serpukhov.su>
Source record: 205826

Hello!

I have buy a new FT-10R. Radio come with the 15hour compact charger BC-60C
and the FNB-41 battery.

In manual I not find enough information how do charging with BC-60 and
how to use external supply for save battery ?

I read (p.62) - remove battery for charging with NC-60.
^^^^ I think it's misprint
and must be read - with NC-50

Can you comment my next opinion:

Charging:

Connect BC-60 to EXT DC jack on radio. IMHO I must do charging battery when
radio is _turn-off_only_ ?

Operation with external (5-12V, 1.5A) power supply:

Remove battery, connect external power supply jack to EXT DC on Radio.
But it's not very comfortable to use radio with open back site..?
If necessary to remove battery for operate with external power supply,
why I not find in an accsessories list a cover for close a back site of radio ?

If possibly to use external supply and do not remove battery, then DC come on
battery, that IMHO is not good.

I'll be thankful for any information. 73! de RX3DIN Victor

>N9MXT - Jeffrey

It's a shame that Jeffrey feels this way about the company, and if I were in his shoes I probably wouldn't disagree. Dick Newell, AK1A (designer of packetcluster {tm} software and company owner) used to run a tight ship. I used to be a packetcluster sysop, and got a high quality product from them -- software and manual. As a guesstimate, there are probably over 200 packetcluser (tm) nodes in operation in the US and maybe that many overseas. It is my understanding that Pavillion software (AK1A) and CT software (K1EA) merged under "Harvard Radio." I have been told that packetcluster (tm) is no longer being supported, and either is in the process or has been transferred to a Canadian venture. CT software is still on the market, but there are rising complaints about a similar lack of service. More opinion: these gentlemen found their 'hobby' software products grow by leaps and bounds over what their 'commercial' software products were growing and were unable to justify much support for the lower margin hobby products. HOWEVER, when you have several thousand users, and a level of dedication to your hobby and the software users, it is hard to just simply pull the plug. As an aside, I have seen some software developed by a ham in Finland (I hope I have his country right) that will play in a network with packetcluster (tm) and is in the beta test phase now. This should be a viable alternative to packetcluster (tm) software.

In summary, I understand how Jeffrey feels but to call pavillion software, packetcluster (tm), etc a scam is simply not true. Shockingly, they may be in the middle of a major upgrade (this would surprise me) and are waiting until they have finished testing. ??? I really don't know. The only statement that I believe may be warranted is that the level of service has dropped to an unacceptable level and does not justify purchase of the product at this time. It is a SEVERE problem that Jeffrey has received neither his software or a reason for the delay.

>I appreciate any and all comments.

Hi Peter,

The reason a small change in power makes a larger than expected change in S meter reading is because S meters are not calibrated to any real standard. There was an attempt to standardize metering at 6 dB per S unit many years ago, but it never caught on. Most S meter scales are now "plotted" at 5 dB per S unit, but the receivers are calibrated for less than that value...usually around 4 or so dB per S Unit

For an example of this, look at Drake or ICOM. They had the meters made for a 5 dB S unit. I just looked at the S meter alignment for a Yaesu. With a 94 dB signal change the S meter is adjusted to move from S1 to S9 +60 dB. That's 4.25 dB per S unit, if it's all is perfect in the "dB" area of the scale!

The ICOM 751A alignment results in around 4 dB per S unit, although the meter scale is set for 5 dB (like Drakes).

AGC voltage tracking also changes from band to band, rig to rig, and even from weak to strong signals.

When I shut my 1500 watt amp off, people usually tell me I drop 20 dB! But the amp only has 12 dB of actual gain! My 1500 watt to 90 watt power change "looks like" a change from 10,000 to 100 watts because of the way meters are calibrated. S meters are designed to make us feel good, not to tell us the truth.

>than a 2 S unit or higher reading at the receiver.

Hi Peter, how many 'S' units of improvement depends on the 'S' meter calibration of the receiver and it is not standardized so what you heard could be both true and false.

When I went from 100w to 600w, it made an almost unbelievable difference partly because of the power increase but also because I was forced to match my antenna system better than before. The improved matching gained me 2 'S' units and the increased power gained me another 2 'S' units measured on N5AQM's receiver.

My advice is to optimize the antenna system first and then decide whether one needs additional power. I often don't need the amp since I optimized my antenna system.

I just read several reviews and purchased the Alinco DR-610. Yes I know that Alinco does not have a big following, but when I looked at what I consider important, Alinco won. For example: I mount the head on the center console and the multiple level function buttons can often become difficult in a mobile. But the 610 ilimunates the name of the activated function level. Second, the mic is simple, it is a mic. Many of the others have put so many features on the mic that it is difficult to hold or to find the button you want. The Yaesu was notible in that there are NO buttons (only one knob) on the front head. This could be used to the advantage that the head is then mounted on top of the dash directly behind the steering wheel so as to be nearly a heads up display. It can then be dimmed so as to not be obtrusive at night, and one then NEVER has to touch it, only controll from the potato mic. But, the dash gets blasted by the sun and I worry about theft with it being so visible.

Lastly, when you look at the QST reviews for specs, the 610 clearly shows one of the better (best?) receivers. As for 9k6 packet performance, I frantly don't think any of the rice box radios are there yet, and I don't plan to use the 610 for 9k6 baud. If you want true 9k6 performance, I suspect that the extra bucks for Azden is worth it, but then you loose small size and feature.

As for Alincos spectum scope...beware that it is performed by the radio literly scanning those channels, thus interupting the disired channel. This may be useful in some conditions, but fortunately is easily turned off!

2121. Wanted manual for Microwave M Xverter

Newsgroup: rec.radio.amateur.equipment

I have a kenwood 241 with the old and infamous display problem.
The display goes haywire every once in a while. The radio has
been out of warranty for quite a while now and I hate to send
it in for repair.

Does anyone know what causes this problem and how to repair it.
I feel I could replace what ever the part is that is bad or
what ever the case may be if I can find out what it is.

Thanks for any help.

From: artburke@sky.net
Message-ID: <4ffsnr$e7e@alpha.sky.net>
Source record: 205887

It's time for my dumb post of the month!

Yesterday I was reading a "white paper" on the Drake R8/R8E that states the receiver is not susceptible to computer RFI. Did I read that correctly? Can you truly place the radio next to your standard, un-modified, (including "painted" monitor) computer and enjoy shortwave/AM without the associated rigors of computer generated RFI?

I'm thinking seriously of purchasing a quality shortwave unit in the next couple of months and this has a great bearing. I can't stand to be in my computer/stereo/ham radio/play room without turning on the computer!

>weeks of each other. I admit I use them
>hard, swapping antennas frequently.

You should realize that BNC (and N) connectors are not
designed for frequent connect/disconnect cycles. I've
seen one manufacturer's literature state that they are
rated for only about 200 cycles during their lifetime.
If you need to do frequent connect/disconnect, then
you need to be using GR type QC connectors. They are
designed for *thousands* of connect/disconnect cycles.

What happens to a BNC (or N) connector when it is repeatedly
connected and disconnected is the center pin of the female
connector *spreads*, and no longer makes good contact with
the male inner pin. Then you have an intermittant connection.

However, what usually goes even faster on HTs is the solder
joint between the inner pin and the circuit board. Every
time you plug or unplug, you flex the center pin, and eventually
that flexing breaks the solder joint to the circuit board.
Just open up the radio and touch the joint with a soldering
iron and function will be restored. (For a while.)

I have a question that you might be able to answer: for CW, one has to set the center frequency (peak). How fine (or how close) are the steps in the newest DSP units? I am currently using an Autek Research unit that is analog.

Also, is the delay noticeable when you're sending CW and working full break-in?

While I don't think much of glass mount antennas in general, and suggest
you drill the hole instead, the Larsen antennas are generally acknowledged
as the best, though not the prettiest.

>Also, whatever happened to E. F. Johnson? Buy out, out of business, what?

E.F.Johson is still in business and still cranking out radios. I do not
have their current address here at the house but will look for it at work
for you.

>
>I do not have model numbers just FCC numbers. The gear in in a grey 4 ft tall
>19 inch rack mount cabinet, with controller, receiver, exciter, 100 watt amp,
>duplexer, and power-supply. The mobiles given to me with the repeater are
>FLEETCOM II's.

>UHF RCVR Data # 023-3823
>UHF TXCVR Data # 242-1000-001
>Duplexer Model # DB-4072

I beleive what you have is a SCR-1000 made back in the early 80's. They
were pretty good repeaters. It has been 15 years since looking at one of
these but the receiver and transmitter sections were Fleetcom II's. The
whole frame of the radio is used but only the transmitter section and
reciever section is installed for each side. The units are installed in
metal boxes on racks that can be pulled out and down for servicing.
I believe that the controller is either Pl or carrier driven but It has
been a long time since servicing them.

>
>Thanks for the Help,
>
I hope to get some more information for you Ed and will look up the address
at work. You might also call information for Waseca, Minn area and ask for
customer service for E.F. Johnson and they might be able to refer you either
to a local dealer or how to order the manual. I hope this helps.

From: fanjoy@io.org
Message-ID: <9Z1GxcGnH8xX085yn@io.org>
Source record: 205902

I am seeking software to operate a Kenwood TS-450 from a computer for use by the blind. Requirements:

Preferably in Basic. I'll leaarn C if I have to but I'd prefer not. I know I'll want to add enhancements and changes.

DOS based, not Windows

If I have the above I can satisfy two other needs:

Accessible to the computer speech processor - no graphics and one piece of information per line.

Very large print on the computer screen

I am a retired engineer who is a volunteer working with the Canadian National Institute for the Blind Amateur Radio Program. It's no small program, since 1967 we have arranged for the provision of over $500,000 worth of HF transceivers to the blind all across Canada. We are currently working on tools to make Amateur operation more friendly for blind operators.

Help appreciated - 73

Bill-

Do you know something I don't? It may be a while before any new HF Ham
bands are added.

I understood the TS-130S came capable of operating on the three current
WARC bands. If they aren't all enabled on your radio, the procedure
should be in the owner's manual.

Hello everybody...

I have an IC-225 Icom transceiver, but some days ago I have a little big problem. When I transmit the transceiver make QRM 55 Khz up and 55 khz down.

I do not nedd to module the carrier, this QRM is done with only pushing the PTT.

I am looking for the schematic of this transceiver to try to solve it..

Perhaps someone can help me and had the same problem than me and solved it ??

Any comments are welcome.

Please e-mail me...
Tnx

I can only tell you that I own an FT-5100 for 2 years now and it has been an outstanding radio. I had the expanded receive mod done and that has worked out well too. We have quite a few hams here in Northern Virginia that use that radio and I have yet to hear a problem with it.

Good luck with whatever you do.

2149. Icom 735 re/MARS & CAP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-10 00:00:00 UTC
From: Thomas.Smith@228.woodybbs.com
Message-ID: <0fa_9602110257@woodybbs.com>
Source record: 205761

Seems like I need a bit of help with this one...have a chance to buy and
Icom 735 AND the AT-500 automatic antenna tuner.

I want to work MARS and CAP, but I need to know if both of these units
can be modified to cover those freqs...ESPECIALLY the auto-tuner...

BTW: Speaking of auto tuners, are there any that handle the MARS and CAP
spectrums? I ask this specifically of the Yaesu FT-1000 model...

Appreciate any and all help on this.

2150. WTD RPT ofs mod for Yaesu FT-690R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-10 00:00:00 UTC
From: stubstad@ix.netcom.com
Message-ID: <4fjagf$l02@ixnews4.ix.netcom.com>
Source record: 205762

I am proud owner of an old all mode QRP 6m brick that has +/- 1 MHz RPT offset (as adder to synth programming in TX?). I have a basic block diagram, but no schematic. Can someone help me with tips on changing the TX offset number. I'd like to set up +/- 500 kHz.

This radio probably uses squelch ckt on FM demod chip, as squelch is not active in SSB and AM modes. Hints on adding sql funct for AM/SSB would be welcome too, tho probably not worthwhile unless there is a simple ckt mod hidden here.

Tnx,
Jim

From: khmi@pfrssl65.tac.fi
Message-ID: <4fi2iu$3r5@tampere.tampere.fi>
Source record: 205834

Hello everybody!

I just got a second-hand Regency UHF hand-held radio to my shack.
I got no manual, battery, or so. Just the radio. I'd like to know something
about it, voltage of the battery needed, frequency range, pinout of the
sockets, and things like that. In the back cover of the radio says:

Regency Land Mobile, Inc.
West Melbourne, Florida 32904

FCC ID ATE5FDRPU402
made in Taiwan, R.O.C

Model RPU 402
Serial number 000700

So if you know a thing of my radio, please let me know as well. If you
know whereabouts its schematic diagram, I will happily pay postage and
costs of photocopying if you send them to me. I'm also interested to get
it converted for 9600Bd TCP/IP packet.

Thanks in advance.

Hi,

If you point your browser at -

http://ukinternet.com/ham/

you will see that the Traders Hall is now open and has it's first
Ham Dealer, taking up a whopping 6 stalls - LOWE ELECTRONICS
Many thanks to Richard for supplying the file.

Anyone trying to set up their *OWN* stall last week would have been
dissapointed as it didn't work (pathnames!). Well I'm sorry and
it's fixed now.

Anyone selling between 10 and 50 items of gear can set up their own
Ham Stall *FREE*.

I'm also after more Ham Rally info -
I will advertise any Ham Rally in ANY part of the World *FREE*

==========
Art,

Any well-shielded radio will not pick up much of that type of interference directly. My ICOM 751 (and Ameritron AL1200 Amp) do not, but I once used an antenna matching unit that let it in, even when only coax was the feedline (ladder line feed is VERY bad in this regard).

When we let it in via the antenna line it becomes a problem, IMO. I use full-shield Belden 9913 into the house from an outside relay-switching antenna selector box, and I get so little computer hash that I just don't ever think about it. Haven't measured it - it is just not a problem here!

You can test your own radio - disconnect the antenna and put a metal cap of some kind over the antenna input. If the noise is no longer objectional, work on the antenna feed system.

Do not worry. I have an old Yaesu FT208R that must be 15 years old and
still holding it's memory with it's original lithium battery.

2159. Re: Drake SW8 wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-10 00:00:00 UTC
From: aa619@detroit.freenet.org
Message-ID: <4fib37$8k0@detroit.freenet.org>
Source record: 205839

In a previous article, newlife@pixi.com (Pat & Adaire Mason) says:

>Does anyone know what kind of internal AM antenna the SW8 has?
>Is it a ferrite loop? I need to know if I can use my inductive
>loop with it. Also, how do you like it? (I have a Drake R8 and
>enjoy it immensely).

The SW-8 uses the internal whip antenna with a preamp for MW reception.
A back panel switch allows an external antenna to also be selected through
either the high impedance wire or low impedance coax connectors.

>>>> I have never used a linear. Some people comments thata linear dramatically improves the chances of a successful long distance
contact.

power X2=3DB
I S-unit =6db (generally)

In a pileup 1 DB can make a difference.
If you are trying to keep a sked with someone an amp will come in handy now and then. I have a large "ALPHA" amp that I have not turned on in over a year. I just do random rag chews and if the person can't hear me I just move on. So unless your are a DX'er you really don't need an amp- even if you enjoy DX you can have great success running 100 watts. ...k2koq

>so from this pin.

The +8 volts is to power the FET in the electret mic element.
Icom specs the *maximum* current to be drawn from this pin as 10mA.

>* The up/down signal appears to be an analog input; the service manual
>says "Up: 5.0V, Down: 0.0V, Off: 5.0V", but I believe this is an error;
>I suspect it is more like 5.0V for up, 0V for down and 2.5V for off,
>but I haven't measured it yet. Under no circumstances exceed 5V
>on this line, since it is connected to the embedded microcomputer,
>and make certain to include some series resistance, say 1k.

Yes, that's completely in error. The Icom "standard" for up/down
buttons is, the up button hard makes to ground to request an up step,
the down button makes to ground through a 470 ohm resistor to request
a down step. External voltage should *not* be applied to this pin at
all, the uP supplies the sense voltage.

>duplex/ or cross band split?

As far as I know, there's no satellite board option for the IC-706.
There is a satellite *box* that you can buy which goes on the CIV
bus and allows two Icom radios to track tune for satellite operation.
That may be what they were saying. With it you could use the IC-706
as the 2 meter radio and the IC475 as the 70cm radio for mode B
operation. The radio doesn't have the circuitry to support full
duplex operation. Most of the circuits serve dual duty in transmit
and receive, IE bidirectional circuits, leaving very little of the
radio available to handle another channel of RF information. You
can set the radio up for crossband split, such as you'd use on
mode A, but it won't track tune or operate duplex.

>also where do you get the service manuals? from your local dealer or
>from icom directly

I ordered mine through HRO. I suppose you could order direct from
Icom parts.

No, of course not. There's no way for a receiver to reject on frequency
RFI without rejecting on frequency signals as well. The R8 may be better
in that it is well shielded so that (mostly) only signals coming in the
antenna connector are heard, but if the antenna or feedline picks up the
computer hash, the radio will receive it.

2165. Question about Internals of Kenwood TK-931

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-10 00:00:00 UTC
From: moofster@netcom.com
Message-ID: <moofsterDMJEqw.Lqn@netcom.com>
Source record: 205845

Has anyone modified this radio or gotten it to work on the 915 MHz band?
A friend of mine has one of these, and upon disassembling it, discovered
an NEC D78310AGF CPU, which does not seem to correspond to any known
general purpose CPU.

Any leads, or information about what this CPU is, or how it can be
reprogrammed would be greatly appreciated.

Please email a reply to moofster@netcom.com -- I am *NOT* a reader of
this newsgroup.

Thanks!
=Robert=

2166. FS 2m Mobile & HT

Newsgroup: rec.radio.amateur.equipment

Icom 280 mobile for sale. Mobile hump mount included.
Icom 2AT HT with plug-in-charger and three battery pack included.

Asking $125 OBO for each

Shipping negotiable,
N8HUJ Rick
